

(NSString *)expressionValueForAttribute:(EOAttribute *)anAttribute

Returns a string representation of anAttribute suitable for use in a SQL statement. Any data paths associated with anAttribute are aliased, in a form such as "t0.l_name".

columnName (EOAttribute)

(NSString *)expressionValueForAttributePath:(EOExpressionArray *)path

Returns a string representation of path, aliased for use in a SQL statement. path is a data path ending in an attribute. Records the relationships up to the attribute and registers an alias used by the context for all future references to that particular relationship path (doesn't register an alias if one already exists). This alias is prepended to the attribute's column name, in a form such as "t0.l_name".
