0b815f5f84012584067f411b312d37OneVision: Edit ± Find ± Find Panel

## Find and Replace

682043\_paste.tiff ↵

The *Find* panel can be reached via the Edit menu of OneVision's main menu or be using the shortcut *Command-f*.

This tool is used for locating and replacing strings of text according to their attributes.

This function applies to all OneVision-Type text elements in a series of linked text frames, including overflow text that doesn't appear in any frame. Text found outside the text frame cannot be displayed.

Note: Find and Replace only works if a text frame is selected or the option <Entire Document> is activated.

### SucheFeld;↵Find

291286\_paste.tiff ↵In this entry field, you enter the text string you are looking for. If you activate the <*Joker*> option, your search string can contain joker or wildcard characters. You can define your own joker character in the field on the right.

Example:

Find: h?t

This search string will find: hat, hit, hot and hut.

This field can also be filled with the <*Enter Selection*> menu command or *Command-e* (see ;../OneVision/MainMenu/Edit/EnterSelection.rtf;;↵).

### ErsetzeFeld;↵Replace

paste.tiff ↵

This entry field is meant to hold the string with which each instance of the search string is replaced.

## **Find Options**

### *Only Words*

Selecting this option finds only whole words. When this option is turned off, searching for <sup>a</sup>and<sup>o</sup> will also find words containing <sup>a</sup>and<sup>o</sup> such as sand, panda, bland, etc.

### *Ignore Case*

If this option is activated, the search function doesn't differentiate between capital and lowercase letters.

## **Scope**

All find operations start at the current cursor position. If the search reaches the end of the text, it starts again at the begin of the text and continues until the cursor position is hit again. The scope can be restricted to the current text flow or extended to the entire document.

### *Entire Document*

If this option is on, all text flows of the entire document are searched.

If the option is off, only the text flow to which the current text frame belongs is searched.

## **Find**

This command starts the search for the specified string. After the first hit, the search is stopped and the matching string is highlighted.

This can also be done with the *<Find Next>* command from the *Find* menu or the shortcut *Command-g* (see ;../OneVision/MainMenu/Edit/FindNext.rtf;;↵).

## **Replace**

This command replaces the found string with the replacement string.

### Find and Replace

This command finds the next instance of the searched string and replaces it with the replacement string.

### Replace All

This command searches for all instances of the search string and replaces them with the replacement string.

399764\_paste.tiff ⇐Clicking this switch expands the panel by displaying the *Extended Options* panel.
