Document

## **Print with Register Document**

This command makes it possible for you to print using a register document, which is a document overlay containing crop marks, registration marks, color marks, comments, etc.

The advantage of using a register document for output is that you can prepare the document without knowing which output device you will be using. If it should happen that a document intended for use with a color printer must instead be output on a film recorder, you can simply append a different register document.

In addition to adding registration and crop marks, using a register document enables you to scale the document pages and even to rotate them. Some sample register documents are included with OneVision.

For detailed information on creating register documents, please refer to the description of the chapter <Register Document> (;../.../PageElement/PageElement.rtf;;¬).

After you select this command in the menu, a file browser will appear. Select the document you wish to use as a register document, onto which all pages of the current output document will be superimposed. This will open print panel, described in the chapter <Print> (;Print.rtf;;¬), where you can enter additional print parameters.
