When you see the **boot:** prompt, type the following if you are booting from a SCSI disk:

```
boot: mach_kernel -s
```

Note: Don't forget the **-s** flag!

8. When you get to a # prompt, make sure the driver update floppy is in the floppy disk drive, and type:

```
# /usr/etc/driverLoader D=Floppy
```

If you are installing onto a SCSI hard disk, mount the hard disk as follows:

```
# mount -n /dev/sd0a /disk
```

(If you are not installing onto SCSI device 0, substitute the appropriate device name for **sd0a**.)

Continue by typing the following commands:

```
# rm -r /disk/usr/Devices/DPT2012.config
# mount -n /dev/fd0a /floppy
# cp -r /floppy/usr/Devices/DPT2012.config /disk/usr/Devices
# reboot
```

When the screen becomes blank, remove the floppy disk from the drive to keep the

computer from trying to boot from it.
