Class java.io.PrintStream

```
java.lang.Object
   |
   +----java.io.OutputStream
          |
          +----java.io.FilterOutputStream
                 |
                 +----java.io.PrintStream
```
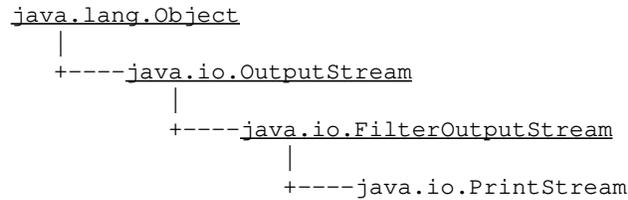

public class **PrintStream**
extends FilterOutputStream

This class implements an output stream that has additional methods for printing. You can specify that the stream should be flushed every time a newline character is written.

The top byte of 16 bit characters is discarded.

Example:

```
System.out.println("Hello world!");
System.out.print("x = ");
System.out.println(x);
System.out.println("y = " + y);
```

Version:
        1.22, 08/12/95

        Arthur van Hoff

Constructor Index

o **PrintStream**(OutputStream)
        Creates a new PrintStream.
o **PrintStream**(OutputStream, boolean)
        Creates a new PrintStream, with auto flushing.

Method Index

o **close**()
>   Closes the stream.

o **flush**()
>   Flushes the stream.

o **print**(Object)
>   Prints an object.

o **print**(String)
>   Prints a String.

o **print**(char[])
>   Prints an array of characters.

o **print**(char)
>   Prints an character.

o **print**(int)
>   Prints an integer.

o **print**(long)
>   Prints a long.

o **print**(float)
>   Prints a float.

o **print**(double)
>   Prints a double.

o **print**(boolean)
>   Prints a boolean.

o **println**()
>   Prints a newline.

o **println**(Object)
>   Prints an object followed by a newline.

o **println**(String)
>   Prints a string followed by a newline.

o **println**(char[])
>   Prints an array of characters followed by a newline.

o **println**(char)
>   Prints a character followed by a newline.

o **println**(int)
>   Prints an integer followed by a newline.

o **println**(long)
>   Prints a long followed by a newline.

o **println**(float)
>   Prints a float followed by a newline.

o **println**(double)
>   Prints a double followed by a newline.

o **println**(boolean)
>   Prints a boolean followed by a newline.

o **write**(int)
>   Writes a byte.

o **write**(byte[], int, int)
>   Writes a sub array of bytes.

Constructors

o **PrintStream**

```
public PrintStream(OutputStream out)
```

Creates a new PrintStream.
Parameters:
    out – the output stream

o **PrintStream**

```
public PrintStream(OutputStream out,
                   boolean autoflush)
```

Creates a new PrintStream, with auto flushing.
Parameters:
    out – the output stream
    autoflush – if true the stream automatically flushes its output when a
    newline character is printed

Methods

o **write**

```
public void write(int b)
```

Writes a byte. This method will block until the byte is actually written.
Parameters:
    b – the byte
Throws: IOException
    If an I/O error has occurred.
Overrides:
    write in class FilterOutputStream

o **write**

```
public void write(byte b[],
                  int off,
                  int len)
```

Writes a sub array of bytes.
Parameters:
    b – the data to be written
    off – the start offset in the data
    len – the number of bytes that are written
Throws: IOException
    If an I/O error has occurred.
Overrides:

in class FilterOutputStream

o **flush**

```
public void flush()
```

Flushes the stream. This will write any buffered output bytes.
Overrides:
flush in class FilterOutputStream

o **close**

```
public void close()
```

Closes the stream.
Overrides:
close in class FilterOutputStream

o **print**

```
public void print(Object obj)
```

Prints an object.
Parameters:
obj – the object to be printed

o **print**

```
public synchronized void print(String s)
```

Prints a String.
Parameters:
s – the String to be printed

o **print**

```
public synchronized void print(char s[])
```

Prints an array of characters.
Parameters:
s – the array of chars

o **print**

```
public void print(char c)
```

Prints an character.
Parameters:
c – the character to be printed

o **print**

```
public void print(int i)
```

Prints an integer.
Parameters:
    i – the integer to be printed

o **print**

```
public void print(long l)
```

Prints a long.
Parameters:
    l – the long

o **print**

```
public void print(float f)
```

Prints a float.
Parameters:
    f – the float to be printed

o **print**

```
public void print(double d)
```

Prints a double.
Parameters:
    d – the double to be printed

o **print**

```
public void print(boolean b)
```

Prints a boolean.
Parameters:
    b – the boolean to be printed

o **println**

```
public void println()
```

Prints a newline.

o **println**

```
public synchronized void println(Object obj)
```

Prints an object followed by a newline.
Parameters:
　　obj – the object to be printed

o **println**

```
public synchronized void println(String s)
```

Prints a string followed by a newline.
Parameters:
　　s – the String to be printed

o **println**

```
public synchronized void println(char s[])
```

Prints an array of characters followed by a newline.
Parameters:
　　s – the array of characters to be printed

o **println**

```
public synchronized void println(char c)
```

Prints a character followed by a newline.
Parameters:
　　c – the character to be printed

o **println**

```
public synchronized void println(int i)
```

Prints an integer followed by a newline.
Parameters:
　　i – the integer to be printed

o **println**

```
public synchronized void println(long l)
```

Prints a long followed by a newline.
Parameters:
　　l – the long to be printed

o **println**

```
public synchronized void println(float f)
```

Prints a float followed by a newline.

Parameters:
        f – the float to be printed

o **println**

```
public synchronized void println(double d)
```

Prints a double followed by a newline.
Parameters:
        d – the double to be printed

o **println**

```
public synchronized void println(boolean b)
```

Prints a boolean followed by a newline.
Parameters:
        b – the boolean to be printed
