Class java.awt.Polygon

```
java.lang.Object
   |
   +----java.awt.Polygon
```

public class **Polygon**
extends Object

A polygon consists of a list of x and y coordinates.

Version:
>   1.6, 10/05/95
Author:
>   Sami Shaio, Herb Jellinek

Variable Index

o **npoints**
>   The total number of points.
o **xpoints**
>   The array of x coordinates.
o **ypoints**
>   The array of y coordinates.

Constructor Index

o **Polygon**()
>   Creates an empty polygon.
o **Polygon**(int[], int[], int)
>   Constructs and initializes a Polygon from the specified parameters.

Method Index

o **addPoint**(int, int)
>   Appends a point to a polygon.
o **getBoundingBox**()

getBoundingBox() – what area does this polygon span?

o **inside**(int, int)

Is point (x, y) inside the polygon? Uses even–odd winding.

Variables

o **npoints**

```
public int npoints
```

The total number of points.

o **xpoints**

```
public int xpoints[]
```

The array of x coordinates.

o **ypoints**

```
public int ypoints[]
```

The array of y coordinates.

Constructors

o **Polygon**

```
public Polygon()
```

Creates an empty polygon.

o **Polygon**

```
public Polygon(int xpoints[],
               int ypoints[],
               int npoints)
```

Constructs and initializes a Polygon from the specified parameters.

Parameters:

xpoints – the array of x coordinates

ypoints – the array of y coordinates

npoints – the total number of points in the Polygon

Methods

o **addPoint**

```
public void addPoint(int x,
                     int y)
```

 Appends a point to a polygon. If inside(x, y) or other operation that calculates the
 bounding box has already been performed, this updates the bounds accordingly.
 Parameters:
  x – the x coordinate of the point
  y – the y coordinate of the point

o **getBoundingBox**

```
public Rectangle getBoundingBox()
```

 getBoundingBox() – what area does this polygon span?
 Returns:
  a Rectangle defining the bounds of the Polygon.

o **inside**

```
public boolean inside(int x,
                      int y)
```

 Is point (x, y) inside the polygon? Uses even–odd winding.
 Parameters:
  x – the X coordinate of the point to be tested
  y – the Y coordinate of the point to be tested Based on code by Hanpeter van
  Vliet .
