

HamLog Version 1.0a

Welcome to HamLog version 1.0a. This is a database exclusively for logging your Amateur Radio and CB calls. It's features include automatic fill in of City and State from Zipcode (Zipcode lookup.) It also feature links to web sites that give you the distance between two points, the ARRL Web Site, and the QRZ website to lookup information on a callsign. This database was created using MS Access 97 and has no runtime files, so you will need a copy of MS Access 97 in order to run it. If enough interest is generated, I will purchase the runtime version for distribution, but only for a fee. Probably around \$34.95 US. You will notice that this version has my coordinates and City information. For each copy you buy, I will customize this information to match you criteria! If you are using this database and like it, please email me at fhamilto@fairfieldi.com and let me know what you think. I am open to suggestions for improvement as well as additions.
