

Steps for Alert

1. Load

Click on the **Load** button to open the HTML file that you wish to add the Alert dialogue boxes to.

2. Select Text or Image

Select (highlight) the text or an image () that you want to cause the Alert dialogue box to open upon the user clicking it. The Alert dialogue box can also be called up through a form button. If you want it to be called up by a form button, just place your cursor within the body tags (<body..>.....</body>) where you want the button to be placed. Please do not select text or an image that already has a hyperlink around it. If the text or image already has a hyperlink around it, then delete the hyperlink code so that Java Script It! can add its own hyperlink. Below are examples of a correct way to select text or an image...

This is some **example** text.<p>

This is some more **** text.

Here are some examples of an incorrect way to select text or an image...

the **** text.

This is some **example** text.

3. Settings

Click the **Apply** button to bring up the settings dialogue box.

4. Message

Type in the message you want to appear in the Alert dialogue box. Do not use commas or else an error will occur in the browser.

5. Options

Choose whether you want the Alert dialogue box to be called up by a hyperlink (**Selected Text** option) or a **Form Button**. If you did not select any text then the **Selected Text** option will be disabled. If you did select text and you choose **Form Button** then the button will be inserted at the beginning of the selected text.

6. Apply

Click on the **Ok** button to apply the Alert script to the current document.

7. Saving Changes

If you want to test the code or just save the file, click on the **Update** button. This button acts like a Save button in most Windows applications. If you decide you want to save the changes under a new name or in a new location, then click on the **Save As** button. After saving you should test the results in your browser. If you are unsatisfied with the results then choose **Revert** under the **Edit** menu. If you are done with Alert then click on the **Close** button (this will not close Java Script It!). If you want to apply Alert to another document, just repeat steps 1 to 7.
