

Index\_ROM.tiff ↵

## Overview

The backup engine is built on top of a generic two pass command processor. It turns out that indexing CDROMS is the same kind of process. The first pass is the creation of a directory, of links that point back to the CDROM. The second pass is the creation of the indices for the CDROM, in the newly created directory of links.

## Usage

Click on the *Index CDROM* menu pick in the *Unrelated* menu. That will bring up a normal backup window, except for the icon on the button. It should look like the icon at the top of this document. Drag the icon for the CDROM into source well and the icon for the directory where the CDROM directory mirror will be built. Then hit the index button. A directory with the same name as the CDROM will be created and indexed in the destination directory.

### **Author's comment**

Yes, I know this belongs in another application. But, do you want it now or later?
