

# Atom Inspector

This inspector allows you to examine the individual atoms in the currently loaded molecule and make a variety of measurements.

Select atoms by clicking on them. Hold down the <shift> key to make multiple selections. Atom position and bonds are displayed for the currently selected atom. You must select an appropriate number of atoms before using any of the measurement buttons. Keep in mind that for bond angles and dihedrals the order in which you select the atoms does matter.

When atoms are selected, they will be marked in the molecule view window. In the quick, stick mode, selected atoms are circled. In the quick space-filling mode, selected atoms are marked with a white dot, except for hydrogens which are still circled. In the normal space-filling mode, selected atoms turn black. In the normal stick mode, atoms are not marked at all (use the quick mode).
