

type selection;¬Selecting The Enclosure Type

536262_PixelRule.tiff ¬

MailEnclosure supports a number of out going message types. The *Type* pull down on the *Compose* panel allows the user to select the type.

plain text;¬PlainText

Just plain ASCII mail. Why you would use this versus Mail.app I don't know. Just here for completeness.

Script;¬ Unix Script;¬UnixScript

Creates an enclosure which is a self unpacking Unix script. Requires the receiving system has *awk* and *sh* to unpack it.

MSMail;¬ MSMail

Creates an enclosure of the type used by the MSMail to smtp gateway used by Microsoft and many other firms. Sorry don't know the brand name. This is basically a string of uuencoded files.

NeXTMail;¬ NeXTMail

Creates NeXTMail enclosure. Again, only here for

completeness.

MIME;↳ **MIME**

Creates a simple MIME enclosure. I say simple because all files, regardless of their type are sent as MIME's most opaque type APPLICATION/octet-stream. It gets the files there as files - not much more.
