

ResDump

ResDump is an application for browsing through Macintosh resource files and **dumping**;DumpResource.rtf;Dump;↵ selections to disk. Dumped selections are exact copies of the selected resource and no conversions are performed upon it. This makes TEXT, snd, ICON, PICT, etc. resources available for use by NeXT users and programmers.

In addition, **conversion**;ConvertResource.rtf;Convert;↵ of certain Macintosh resource Types to NeXT usable formats is supported as well. *ResDump 1.0* currently only supports "snd" and "ICON" type resource conversion, but others like "PICT" are on the way for future releases.

This is a ShareWare program so if you are pleased with this program, please send a \$10 contribution with your address to the address below and I will try to keep you up to date on the current

version. Also, this is currently the only way for me to receive bug reports.

This first version has some quirks but I don't really qualify them as bugs. I will try to get these cleaned up as soon as possible. The Sound Panel controls work pretty much as shown. I don't have an automatic conversion option yet but that is one of the quirks. The Next prefers to use sounds at predefined rates so most Mac sounds need to be converted to these rates. I have selected the 22K rate as the default conversion rate and you will have to manually convert a sound to this after you have double clicked on a particular sound recourse.

Mainly, I just wanted to get this program in the public and get some feedback.

(Only directories or files with valid resources will be displayed in the file browser. Some valid files may be omitted from the file browser due to "name length" restrictions. Apparently, there is a 32 character file name limit for mounted Macintosh file systems. If anyone out there knows a remedy, I would be pleased to know how.)

(P.S. Job offers are welcome)
