

# The value view

Line.tiff ↗

The value view's purpose is to inspect and change the value of a selected default. Normally you don't need to see the value of every default therefore it's reasonable to save screen space for information that isn't needed all the time. Clicking the toggle button makes the value view visible:

paste.eps ↗

PixelRule1.tiff ↗

- The save; ↗**Save** and revert; ↗**Revert** buttons are enabled only if the value has changed.
- To store a change it must be confirmed by clicking **Save** or typing `<enter>`.
- To prevent a change you can: click **Revert**; type `<esc>`; hide the value view; select a new item in the main browser; select a different Preferences module.
- Typing `<return>` won't store the new value in the database but insert a newline character in the text!
- The value view is editable and selectable only if exactly one owner and one default are selected. In all other situations the following is shown:

noSingleSel; ↗noSingleSelection.tiff ↗

25682\_PixelRule1.tiff ↗
