

# "Owner Search Paths" preference

Line.tiff ↵

The Test command looks in the paths listed here for equally named applications for all owners.

"Equally named" means an executable *name* or *name.type* for an owner *name*, where *type* is one of the file types given in the "Owner Types" preference.

PixelRule1.tiff ↵

- Black entries are user defined and can be removed, gray ones are predefined and not removable.
- A double click on a path name (even if it's gray) marks it as recursive, i.e. not only the directory itself will be searched but also all subdirectories within it ± and their subdirectories. A second double click resets this function.

ρεμωε;←• Pressing <Alternate> while clicking on **Remove** deletes the selected path only if it doesn't contain any owners; otherwise the error beep sounds.

- No multiple selection possible.
