Possible extensions:
> Provide support for creating and deleting prototype files.

> Get services to work properly (I believe the situation in 3.0 is better, so I'll probably wait till I get 3.0).

> Allow a file to be executed to create a new file, rather than copied.

> Allow the permissions to be set.

> Allow command-keys to be defined.

If anyone has any bright ideas, feel free to add them (please send me a copy) or mail me and I'll maybe get around to implementing them (though that's unlikely as I've enough to do for the NeXT year.)
