Automatic Host Configuration window

SA4padPointRule2.eps ¬
Use this window to enable or disable automatic host configuration.

You can also change the range of Internet addresses assigned to new hosts and the temporary Internet address used while you're adding computersÐand determine which password, if any, is required to add a host to the network.

You choose Network *submenu-arrow8.tiff* ¬ Automatic Host Configuration from the HostManager menu to open this panel.

CAUTION You can enable automatic host addition for the root domain (*/*) or one midlevel domain. Don't enable it for more than one midlevel domain on any subnet: new hosts will join any one enabled domain unpredictably.
