1.1   Icon Tool Archives

```
Filename            ComandsSizeDescription
addinf10.lha            VX    30K AddInfo v1.0 © 1994 by Michael Barsoom.
                                  Add icons to files that don't have them.
apoint10.lha            VX   157K AnimPoint 1.0 by Steve Koren – A pointer
                                  animator for AmigaDos 3.0 or later (it
                                  might also work on OS 2.1, but I've only
                                  tried it under AGA), and >=68020 CPUs. It
                                  supports standard IFF anim-brushes or op-5
                                  animations, 16 colors sprites, ARexx, icon
                                  direct-drag-and-drop, a GUI, and double
                                  buffering pointer images in FAST RAM.
ficon11.lha             VX    56K ForceIcon 1.1 by Kai Iske – This allows
                                  the user to select positions for his/her
                                  Disk.info files, either device dependant
                                  or volume dependant, ie. ForceIcon will
                                  either monitor all volumes inserted into a
                                  device, or just those specified by the
                                  user.  It is also possible to override the
                                  settings for a device if you specify the
                                  Icon.
iconupd.lha             VX    20K IconUpdate 3.0 by Martin Huttenloher /
                                  Gerri Körner – This contains IconUpdate
                                  2.0/3.0.  It is a replacement for my
                                  IconUpdate  program distributed with
                                  MagicWB 1.2p/1.5. There are some minor
                                  changes in IconUpdate 2.0 to Martin
                                  Huttenloher´s IconUpdate 1.5, based on the
                                  same code. Has a new GUI.
IconVenP.lha            VX    24K Icon-Vendor PRERELEASE by NocTurne –
                                  Icon-V is an icon-management program. Say
                                  you are a workbench user and just got a
                                  new proggy,  but the guy who wrote it
                                  didn't include an  icon. Well, just open
                                  up Icon-V and throw  the 'Show-All' icon
                                  onto one of the icons in the dock that
                                  best represents the function of the program.
iff2icon.lha            VX    27K IFF2Icon 1.0 by Tropic Design – This is
                                  used via Shell and converts IFF-picture of
```

```
                             any size into Icons.
opticon-1.8.lha      VX   57K OptIcon 1.8 by Tobias Ferber - Reads in
                             given ".info" files and scans the icon
                             image in order to optimize the PlanePick
                             and PlaneOnOff fields in the icon Image
                             structure.  This is a space-saving
                             mechanism for image data.
scalei15.lha         VX   26K ScaleIcon 1.5 by Frode Fjeld - This
                             enables you to scale your Workbench icons
                             in a  simple and convenient manner. It
                             supports scaling by fraction (in percent),
                             by  absolute sizes, halving and doubling
                             and to use an icon (size) as template. Any
                             of these actions may be performed on any
                             one or both axes.
swaz10.lha           VX   40K Swaz Info 1.0 by David Swasbrook - This
                             replaces workbench's icon information
                             window while still retaining all the
                             information and options and providing more
                             window but with several enhancements.
                             Features added in addition to normal
                             Workbench Information.
trashic.lha          VX   11K TrashIcon 2.2 by Mark McPherson - This
                             places an icon on the WorkBench, and will
                             delete any files dragged to that icon by
                             the user, ie it uses the WB2 feature of
                             AppIcons.  TrashIcon is highly
                             configurable and gives the user great
                             flexibility over what is deleted.
trashit.lha          VX   40K TrashIt 1.01 by B. Wynants - The workbench
                             has a standard trashcan for every disk.
                             TrashIt is an AppIcon that puts an icon
                             on  the workbench screen, and deletes all
                             files or formats all disks that are
                             dragged onto  it. It also updates the
                             workbench window so you can see what was
                             deleted without  reopening the drawer.
```
