Compendium Deluxe #1 Window Enhancement Menu

1.1 Window Enhancement

Filename	Comands	Size	Description
dragit4.lha	VX	48K	DragIt 4.00ß by Steve Lemieux - This program allows you to move or size a window without using the drag bar or the sizing gadget. How? Press on the configurable qualifier, while holding it, press your selected mouse button, and move the mouse. You'll see the window border appear, and you'll be able to drag or size it.
huntw33.lha	VX	26K	Huntwindows 3.3 by Jörg Bublath - Coming with KS2.0 you can make screens bigger than the visual size of your monitor. After I tried to catch windows like requesters etc. on my double-sized workbench, I got enough and wrote this little tool.
ptool12.lha	VX	28K	PaletteTool 1.2 - a Public Screen palette for 32 or more colors by Timothy B. Kreuzer. Only works from WB.
setwin10.lha	VX	11K	Setwin 1.0 by Frank Würkner - This let's you manipulate nearly everything of a window. You can change the size, position, window limits, the zipped size and titles (window and screen). Of course you can also cause actions on the window such as to activate, zip, bring it in front/back, center and close/kill it.
wb-ver12.lha	VX	6K	WB-Version 1.2 by Håkan Hellberg - This is my solution to a minor annoyance. When using the Workbench and wishing to find out the version of a program/file you'd so far have to resort to the shell and do a version command. No longer! It's meant to be used with ToolManager.

wbsearch.lha	VX	9K WBSearch 1.0 by Mike Austin - This is a simple file searching utility that opens an AppMenuItem for itself and stays resident.
wbvwm20.lha	VX	7K WBvwm 2.0 (Workbench Virtual Window Manager) by Juhani Rautiainen - With Workbench 2.04 we got ability to use bigger Workbench screen than fits on the display (virtual Workbench screen). The biggest problem was that scrolling around with mouse was too slow. So now its not!
welc2205.lha	VX	43K Welcome 2.205 by Urban Lindeskog - My startup-sequence didn't echo anything, thus no initial CLI opens. It looked quite boring whith the blank screen while the machine was booting, so I thought of Macintosh with it's "Welcome to Macintosh"-requester. Requires AmigaOS 2.0 or higher.
whunt_10.lha	VX	14K WindowHunter 1.0 by John E. Perry - When your program stops running, pretty much everything is okay, but either you forgot to close windows and screens OR the program terminated abnormally and didn't get around to those routines. Unlike Unix Operating System, AmigaDOS won't clean up the mess.
wimpx15.lha	VX	38K WimpX 1.5 by R.C.Meathrel - This allows the intuition environment to be explored and altered. The WimpX project was undertaken due to the appearance in my disk box of a similar style of program - Fenster. After I first came across Fenster and began using it, mainly for the screen save, I was myself inspired to write a similar utility.
windaem.lha	VX	33K Window Daemon 1.0 by David Swasbrook - This gives you more control over intuition windows and screens.
