

MemStatus 1.1

MemStatus shows 32-bit Windows' (NT, 95) current memory status (physical memory in use, paging file in use, and overall memory load). As a percentage of use ascends, its bar becomes redder, its background darker blue. Anything above 80% will cause the percent digits to become red.

The window will remember it's size and position (to restore it to the default size, use the right-mouse-button menu, and select Default Size).

Freeware

You can distribute this program as long as you don't charge or change anything.

Be sure to check out my other Windows share/freeware:

Alarm - an alarm/reminder application

QuickDex - a Rolodex-like application

StpWatch - A very efficient stop watch

ReDate - Basically a touch utility with a graphical interface
