

SRS Demo is a little Visual BASIC program I put together to demonstrate the enhanced sound and music that you can get with SRS processing. You do need a 16-bit sound card to play these samples, but you don't need SRS hardware to play back sound that's been processed with SRS.

In addition to a 16-bit sound card, you also need to have the Microsoft ADPCM sound driver installed. You can determine if you have it by looking for Sound Mapper in the control panel. Sound Mapper is installed by many CD-ROM programs, including the Video for Windows setup program on The Disc!

The MIDI file used for the recording is courtesy of Music Bytes by Prosonus Inc. The sound effects are from 1000 of the Worlds Greatest Sound Effects, by Interactive Publishing. The sound files in this directory are intended only for use with this demo and can not be redistributed or used for other applications.
