If the job prints very slowly, follow the steps listed below.

Check the Windows NT machine's I/O board or motherboard for hardware conflicts. This symptom is almost always caused by a previously unnoticed interrupt conflict.

Printers and Local Data Transmission

In this section you will be asked a series of questions. Choose the ones that apply to your particular situation.

Does the job print very slowly? You answered No to this

Is any hardware except the cable (such as a switchboard) installed between the computer and the printer?

If there is no hardware other than the cable (such as a switchboard) installed between the computer and the printer, follow the steps listed below.

1. Run WinMSD to view the Windows NT configuration. Verify that this matches your hardware.
2. For serial printers, confirm that the communications settings (data and stop bits, flow control, baud rate) used by Windows NT match those required by your printer. The Serial Port Access and Use topic may also help you troubleshoot this problem.
3. Check hardware for interrupt conflicts. For more information, refer to the Troubleshooting chapter of the Windows NT Resource Guide.
4. Damaged or defective cabling can prevent Windows NT from printing correctly, even if applications can print when the machine is booted under another operating system.

If the message you are receiving indicates that NTLDR could not be found, follow the steps listed below.

The NTLDR file is either missing or it is corrupt.

1. If the boot partition is FAT, boot MS-DOS from the dual boot menu or from a system disk. EXPAND NTLDR from the Windows NT diskettes as follows:

```
expand A:NTLDR._ C:\NTLDR
```

or COPY NTLDR from \i386 on CD-ROM to C:\

2. If the boot partition is HPFS or NTFS, go to an MSDOS computer.
3. Backup SETUPLDR from the SETUP disk and delete EXPAND NTLDR._ into SETUPLDR on the SETUP disk.
4. Create minimal BOOT.INI with the following:

```
[boot loader]
```

```
default=<drive letter>:\<path to Windows NT files>
```

```
[operating systems]
```

```
<drive letter>:\<path to Windows NT files>="Windows NT Version 3.1
```

5. Boot the computer from the diskette.
6. Copy NTLDR from the diskette to C:\.
7. Remove the diskette and restart Windows NT.

PostScript Printing

In this section you will be asked a series of questions. Choose the ones that apply to your particular situation.

Does the problem cause an error message to print? You answered Yes.

No

If the problem causes an error message to print

Most PostScript errors contain an "Error" component and an "Offending Command" component (OC). The following suggestions are based on common values for these components.

1. Error "Undefined". If OC is "md" the print job was created on a Macintosh without the proper header. If OC is unreadable or garbage text, there is a corrupted graphic in the document or a data transmission error. If OC is a printer feature command such as "setduplexmode", the job is targeted for the wrong printer (using the wrong PPD file).
2. Error "limitcheck" or "VMError": a data object is too complex; there are too many downloaded fonts; or the printer has insufficient RAM.
3. Error "IOError": data transmission problem; usually incorrect baud or parity settings on the output port, or line noise.
4. Error "rangecheck" and OC "setpageparams": print job requested paper or film size larger than printer can provide.
5. Error "dictfull": report problem to Windows NT Product Support.

The following section describes miscellaneous printing issues.

- Unless listed by name on the Hardware Compatibility List, Windows NT only supports PostScript cartridges made by the manufacturer of the printer in which the cartridge is installed.
 - Most imagesetter problems that are reproducible on the imagesetter at 300 dpi on Letter paper can be reproduced (and more easily debugged) on a desktop PostScript printer.
 - Some 16-bit Windows applications which have PostScript-specific features, such as color separations, may not enable these features under Windows NT.
 - Print to an EPS file only to create an importable graphic. To create a printable output file, print to the file: port. For additional information, refer to the Printers in General topic in this help file, or contact Windows NT Product Support.
