CodeList

CodeList is a Windows application to print ASCII files under Windows. It supports drag and drop operation, making it useful as an icon on the bottom of your screen, and is configurable for font, printer orientation, number of print columns, presence of line numbers, and other features. All the settings you choose (as well as the size and position of the CodeList window when not iconized) are remembered between invocations.

CodeList solves the problem of how to get text file listings under Windows. Under DOS, one could always use the PRINT command, or could copy the file directly to the PRN device. Under Windows, however, you have had to use a program such as NOTEPAD to do printing for you. I found this inconvenient, since NOTEPAD added margins I didn't want, and could not do multiple columns or line numbers. I also found other printing utilities inconvenient because they required more intervention from me than simply "do it." Hence CodeList.

Like many of the other utilities in this collection, CodeList consists of both the program and a help file. These files need not be in the PATH; you can install CodeList by copying them to wherever is convenient. The settings of the various CodeList options are stored in the file PRESS.INI in your Windows directory, so CodeList doesn't clutter up your WIN.INI file.
