Purpose: The MenuOfColors form allows a popup menu or application menu to display a palette of colors.

Usage: Set the entries of the menu to the indices of the colors. Color indices range from 0 to 255. Set the title to the number of columns. If the title is blank or not a number, FaceSpan does some default thing.

An application menu's form property can be assigned only while the application is running; it is not retained when the application stops.

Example: The contents of a popup menu that displays the grays from white to black:
