

Every tile has its own pop-up menu, called a tile menu. The tile menus let you do many different things with tiles.

- Click and hold: Hold the mouse button down on a tile to see its menu. After a brief delay of about a second, the menu will appear.
- ⌘-click a tile to see its menu instantly. This is the same as click-and-hold, but faster.
- Control-click a tile to see its contextual menu, which is slightly different from its normal tile menu.

Tile menus vary, but all tile and contextual menus have the same first eight items:

- Open (Item Name) — Selecting this is the same as clicking the tile: the tile's item is opened and brought forward.
- Get Info switches to the Finder and opens the Info window for the tile's item.
- Find Original opens the folder that contains the item, and selects and displays the item in the Finder.
- Remember Tile makes this a remembered tile. See [Creating Remembered Tiles](#) for details. If this is already a remembered tile, this menu item will be "Forget Tile."
- Hide Tile makes the tile invisible without deleting it. See [Hiding Tiles](#) for details.
- Tile Color lets you select a custom background color for this tile.
- Edit Tile Text lets you change the text displayed on a tile. See [Editing Tile Text](#) for details.
- Hot Key lets you assign or remove a hot key for this tile. See [Setting Hot Keys](#) for details.

For info about other menu items that differ from tile to tile, see:
