

Thank you for trying DLL Master. We hope you will find it a useful Windows tool.

DLL Master lists all modules currently loaded in Windows' memory, and allows you to load, unload, or decrement the use count of DLLs--at your own risk, of course. Module path, date, time and filesize are shown; multiple lists are kept, lists can be compared, and printed or saved to disk. Specific DLLs can also be loaded at Windows' startup. Requires Windows 3.1.

DLL Master is a shareware program written in Visual Basic, and as such requires the VB 3.0 runtime module VBRUN300.DLL in order to run. Since VBRUN300.DLL is huge, it is not distributed with DLL Master, but it is commonly available many bulletin boards including Compuserve. (Another required Visual Basic module, CMDIALOG.VBX, is included.) If you can't get hold of a copy of VBRUN300.DLL, send us \$3.00 to cover disk and postage and we'll send it to you.

To install DLL Master, just unzip it into a directory, then create a Windows program item that has as its command line property [your drive]\[your directory]\DLLMSTR.EXE. You can use DLLMSTR.ICO as the icon for the program item.

Please contact us if you have any questions, problems or suggestions for improvements to DLL Master. We also strongly encourage you to register your copy if you find yourself continuing to use DLL Master (please read LICENSE.DOC).
