This is the source code of NewFIle version 2 for NeXT 2.1 (maybe 2.0 and 3.0). If you can't/don't want to compile, the binary should be available from wherever you got this.

The application code is divided as follows:

Main	Application delegate and miscellaneous routines.
Server	The services delegate.
Proto	A filetype.
Protos	A list of Proto's.
services	List of predefined services.

Other files needed are

    blanks/*   The prototype files for the predefined file types.
    Help/*   The help files.
    NewFilerc   Used to create a user's rc file when application is first run.
When installing, make sure these files and directories are copied.

Sorry for the variety of programming styles; I've jumbled together pieces from other applications. The various type casts to (char *) are to eliminate the warnings about const/non-const pointers.
