

Welcome to NIST Synchronicity

Synchronicity™ is a Preferences module for synchronizing your computer's internal clock with the National Institute of Standards and Technology's (NIST) cesium clocks via a modem. The service is free, save the long distance charges you may incur during the call.

Synchronicity can be invoked thru the Preferences application, a cron script or the command line.

Synchronicity Features

Works with all Hayes compatible modems

Synchronization of the computer's clock can be immediate, or the clock can be slowly corrected without ever 'skipping' time. Time correction adjustment may be useful in cases where changing the computer's time may cause important automated tasks to be skipped.

Synchronicity also provides a front-end to ntp. Allowing you to synchronize your computers clock to a host running ntp time server.

Standalone Synchronicity licenses are \$30. Network Licenses are \$65
