

Chapter 17

Localization

EquationBuilder has been written with localization to other languages in mind.

Although, as supplied, EquationBuilder is not localized to any language but English, facilities are provided for those ambitious folks interested in localizing EqB to their native tongues.

All localizable resources are supplied in the English.lproj subdirectory within the EquationBuilder.app file package. These resources include numerous Interface Builder™ (.nib) files and two strings files, Localizable.strings and Registration.strings. The two strings files contain all localizable text strings that EqB uses to communicate with users.

• **Note**

Although all of EquationBuilder's localizable resources are contained within the English.lproj subdirectory, there is one other localizable resource:

The EQNInspector.bundle, which supplies the Workspace Manager with an .eqn contents inspector, also contains an English.lproj subdirectory with a localizable interface file (EQNInspector.nib).

Refer to Chapter 14 for more information about the EQNInspector.bundle.

For information on how to localize an application, please refer to the appropriate NextDeveloper documentation.
