

Eject Disk

Eject Disk automatically ejects Zip disks, and works the same as dragging the disk to the Trash icon in Finder. Use Eject Disk when you want to set disk protection options on more than one Zip disk or erase more than one disk in a single session.

If the disk will not eject, you will see one of the following error messages indicating why:

If file sharing is on, the Zip disk cannot be ejected until file sharing is turned off.

If an application or file on the Zip disk is open, the disk cannot be ejected. Close files and quit any open applications, then drag the Zip disk icon to the Trash icon or return to Iomega Tools and use the Eject Disk button again.
