| Packages | Description |
| <ul style="list-style-type: none"> Splash v3 | <p>Very pretty Splashscreen and application launcher. Highly configurable.</p> <p>Xbase++ applications require some time to load and then initialise the runtime system before the application dialog can be displayed. If you want a splashscreen displayed so the user knows something is happening, then this will do it for you.</p> <p>Written in Delphi, it is a small executable which when run will launch any Xbase++ application. It displays a highly configurable splash dialog, launches your application, and when your application's Application Window appears, Splash terminates itself.</p> <p>Splash is 'smart' - if your application is already running, it makes it's AppWindow visible (restoring it if it is minimised) and forces it to the front of all other applications.</p> <p>Handles GUI and CRT mode applications equally well.</p> <p>Splash can be configured to launch many applications - all you have to do is select which application to launch. For each application, you can configure:</p> <ul style="list-style-type: none"> • Text in Splash's titlebar • Main text displayed on splash screen • Copyright text displayed on splash screen • The image displayed (BMP,ICO,EMF) • Parameters passed to launched application • Minimum time splashscreen is displayed • Maximum time splashscreen is displayed (timeout) • Linger time if requested application is already running • Don't force application to front if it is already running |
