Hu6280/MacOS

Current Version
v1.8.9v4 - February 5th, 2000

u6280/MacOS is an PC Engine/TurboGrafx16 Emulator for the Macintosh.

Hu6280 features reasonably good compatibility, although at present, unlike the PC version, does not have sound. This is because the author of the PC version has not, despite repeated requests, sent me sound code. Don't bother me about this, please. Also, Street Fighter II does not work correctly because I am missing the required code. The archive includes a copy of the Jamanoid ROM, developed exclusively for use with Hu6280.

u6280 was initially developed for DOS by "Jamsponge". He has now ported it to Windows too. The source code for Hu6280 is not available to the public.
