

ROM Info Series

Current Version

v1.5b2 - June 23rd, 2000

There is a huge amount of software available for use under emulators. However, organising it can prove extremely difficult - especially if you have a large collection. I have written a number of utilities to attempt to solve this problem for 18 different platforms - and I hope to write more in the future.

Right now, these platforms are:

- Atari 2600
- Atari 5200
- Atari 7800
- Atari Lynx
- Atari Jaguar
- Bally Astrocade
- Colecovision
- Gameboy
- Genesis/Megadrive
- MSX
- Neo Geo Pocket
- Nintendo 64
- NES
- PCE
- Sega Master System/Game Gear
- SNES
- Vectrex
- Virtual Boy

Note that Atari 7800, Atari Jaguar, Neo Geo Pocket, and Virtual Boy are only available in a beta version. The latest stable release is v1.4.

A screenshot is available on the WWW.

While not all the ROM Info applications include all of the features below, they all include some subset of the following features:

- The ability to display the information embedded in the ROM - or if none is present, to display information about the ROM taken from an internal database in the programs.
- The ability to rename the ROM to its correct name according to a set list of criteria.
- The ability to save the ROM's information to the finder comment field.
- The ability to save or print a list of ROMs.
- The ability to change the file's Type and Creator to popular emulators.
- The ability to compress ROMs using gzip, which can be decompressed transparently by many

popular emulators.

- Many other features.
