

This script will retrieve the last trigger information from the IPNetSentry FBA and send this information to the Scriptable Text Editor.

You can run this script at anytime to retrieve the last trigger information stored within the IPNetSentry FBA. This script can also be the basis of a new logging mechanism for the IPNetSentry FBA.

Requirements:

- The Apple "Scriptable Text Editor" application

You must do the following IF you wish to make this script automatically invoked by the IPNetSentry FBA:

- save the script as a "Run-Only" application with "Never Show Startup Screen" checked
- put this script in your Preferences folder
- configure the IPNetSentry file so that it is using "applescript" notification and that you have set the name of your AppleScript. You can do this through our Web configuration page (using the Companion Application) or by manually editing the IPNetSentry Config file with a text editor. Example of required "set" commands in the IPNetSentry Config file:

```
#set\nnotification_type\applescript  
#set\napplescript_name\My IPNS Log AppleScript
```

where "My IPNS Log AppleScript" is the name of your AppleScript.
