

WARNINGS

We have made all possible efforts to make the software as stable as possible. Special precautions have been taken to prevent that in case of a crash the KeyStrokes application takes down the whole system with it. Still we cannot guarantee that this will never happen on your system.

Warning1: If possible avoid running KeyStrokes when you are installing new system software!

Warning2: The proper operation of KeyStrokes may be affected by running certain games, even after you have quit the game application!

TIPS

Σ The TSM Fix extension that is automatically installed in the Extension Folder of your System Folder should not be removed. If you do not have TSM Fix installed some clicks may seem to "go through" the KeyStrokes on-screen keyboard.

Σ If the cursor keys are showing text instead of arrows (or very ugly arrows) make sure that the complete Symbol font is properly installed on your computer.

Σ If you use KeyStrokes with a Keyboard Layout of a non-Roman script make sure that you have selected an appropriate font for that script to "See What You Get and Get What You See". This can be largely automated by selecting "Try to synchronize keyboard layout, font, and dictionary" in the Prediction Preferences dialog (choose "Prediction Preferences..." from the File menu).

Σ When you turn on the option key of the on-screen Keyboard a few keys are outlined with a black box. These are so-called "dead keys" that allow you to type accented characters just as with a normal keyboard. Depending on the type of font you have chosen this represents true "What You See Is What You Get". After pressing such a dead key no character will be generated, instead the keyboard will show you which character it will generate when you press the second key.
