## Configuration Manager v2.0 (C) 1994 Ad Astra Solutions

If you maintain multiple **AUTOEXEC.BAT** and **CONFIG.SYS** configurations,
then Configuration Manager might just help you out.  The file window
displays all of your available Autoexec.* and Config.* configurations.  The
buttons have the following functions:

| | |
|---|---|
| **Edit**: | During **Manual** (file window) selection, brings the selected file into your editor. During **Preset** selection, brings the **Autoexec** and/or **Config** selections into your editor. |
| **Save As**: | Copies the selected file to a new extension. |
| **Clear**: | Clears the **Autoexec** and **Config** selections and **Description** fields. |
| **Delete**: | Deletes the selected file. |
| **About**: | Registration Information. |
| **Use**: | Copies the **Autoexec** and **Config** selections over Autoexec.Bat and Config.Sys. |
| **Exit Win**: | (Visible after pressing **Use**) Exits Windows and Reboots your system. |
| **Close**:  Exits Configuration Manager (without rebooting). |
| **Help**: | These instructions. |

**Preset** Buttons:

Double-click file names or use another **Preset** button to populate the **Autoexec**
and **Config** fields.  The field to the right of **Descriptions** is the button
label. The             field below is a long description of the configuration.  After supplying this
values,            click the **Set** check-box and then the desired **Preset** radio-button.

**NOTE:**  After using the **Clear** button, you must still re-**Set** the particular button.

## Installation

Copy ConfgMgr.exe to any place on your hard disk.  Only **VBRUN300.DLL** needs to
be in your path.  Follow the regular procedure for adding a new Program Item into

any Program Manager group, but set the Working Directory to the location of your configuration files (most likely C:\).  This second step is not necessary, but it will save your having to browse for the location each time.  You may, of course, run this program directly from the File Manager.

## Customization

After the first time you use ConfgMgr, you will find the file ConfgMgr.Ini in your Windows directory.  The **[Preferences]** section contains values you may wish to modify:

Editor=NotePad.Exe      The default editor used to update the **Autoexec** and **Config** selections.

EditorArgs= 1      If you specify 2, both the **Autoexec** and **Config** selections will be passed to the editor when **Edit** is pressed for a **Preset** selection.  This doesn't work for
either      the Windows NotePad or Write applets.

Preset= 1      The last **Preset** button you selected.

Confirm=Yes      If **Yes**, you will be prompted before AutoExec.Bat and Config.Sys are over-written. If **No,** the only indication you will get of the files being overwritten
is the      appearance of the **Exit Win** button.

AutoExit=No      If **No,** you must press the **Exit Win** button to restart your system.  A **Yes** value is equivalent to a **Use** followed by an **Exit Win**.

Once you have become comfortable operating ConfgMgr, the optimal settings are to have Confirm=No and AutoExit=Yes.  This will allow you to select amongst your presets and press **Use** restart your system.

## Registration

That's all there is to it.  But one last thing ... please support the **Shareware** concept!
If after 30 days you continue to find this program useful, please send **$10.00** to:

> **Ad Astra Solutions**
> **P.O. Box 58164**
> **Houston, TX  77258-8164**
>
> Phone:  713-486-8740 x227
> CIS:    70372,2473

Registered users will receive the latest version of the program.
