

- **Report Trap Patches:** This option tells Conflict Catcher to report the system traps that are patched by the individual startup files. It requires reordering to be enabled. When this option is enabled, after the Macintosh has started up, System Reports will present the information about what system traps were patched by what startup files. The system patches are presented in the order in which they were patched. Conflict Catcher maintains an internal listing of the system traps that have been published by Apple Computer, Inc. This listing is updatable. Please refer to the manual for more information on updating this list.

- **Estimate Memory Use:** When not Conflict Testing, Conflict Catcher will estimate and display the amount of memory that will be used by the currently select startup files.
