

- **Log Conflict Test:** This option causes Conflict Catcher to maintain a log of all the Conflict Tests performed. The log is kept in a file called "Conflict Test Log" in the System Folder. It will tell you what files were tested, and the results of the test.
- **Restart Between Tests:** This option defaults to off. If enabled, Conflict Catcher will restart the computer after changing the startup files, so that they can load without Conflict Catcher. This option guarantees that Conflict Catcher's control panel is not part of the problem.
