

Startup Sets

The set menu allows you to define sets of frequently used startup files. You can also specify a startup key for each set. When you hold down a startup key at startup time, Conflict Catcher will activate that set.

- **Original Settings:** This option will revert the selections to the original settings.
- **Create Set:** When you select Create Set, Conflict Catcher will ask you for the name of the new set. At this time, you may specify a startup key for the set. The new set will adopt the current state of the startup files.
- **Startup Key:** Allows you to change the startup key for the selected set.
- **Delete Set:** Deletes the currently selected set from the set menu.
