Links can be used to specify relationships between the various startup files.   There are three different types of links:

• Grouped Link: This type of link indicates to Conflict Catcher that the startup files linked are to be treated as a single entity.   That is, whenever you click on one of the startup files, all of them are acted on.

• Incompatible Link: This link type indicates that the specified startup files are never to have more than one on at any given time.   If you click on one of the startup files, the rest are disabled.

• Forced Order Link: This link forces the startup files to maintain an order.
