11. System Management and GDMO Definitions

The operation of the inter-domain routeing functions in a BIS may be monitored and controlled using System Management. This clause contains management specification for IDRP, expressed in the GDMO notation defined in ISO 10165-4.

11.2 Local BIS Managed Objects for IDRP

idrpConfig MANAGED OBJECT CLASS

    DERIVED FROM ″Rec. X.721 | ISO/IEC 10165-2 : 1992″: top;
    CHARACTERIZED BY idrpConfigPkg PACKAGE
    BEHAVIOUR iDRPBasicImportedAlarmNotifications-B

        BEHAVIOUR DEFINED AS Imports the communicationsAlarm notification from ISO/IEC 10165-2. It is used to report the following protocol events:

        errorBISPDUsent: Generated when a BISPDU is received with an error in its format. The significance sub-parameter of each item of additionalInformation shall be set to the value False′ (i.e., not significant) so that a managing system receiving the event report will be less likely to reject it. The probableCause shall be set to NLM.communicationsProtocolError. The perceivedSeverity shall be set to ′Minor′. A subsequent communicationsAlarm with a perceivedSeverity value of ′Cleared′ shall not be generated. No other fields or parameters shall be used, with the exception of further parameters in the AdditionalInformation field, as follows:

        a) RemoteBIS-NET for BIS-BIS connection--using the notificationRemoteBIS-NET parameter
        b) BISPDU error code (see 6.4 and 7.20)--this reports the error code that will be sent in the ERROR PDU using the parameter ″notificationBISPDUerrorcode″.
        c) BIS error subcode (see 6.4 and 7.20)--this reports the subcode that will be sent using the parameter ″notificationBISerrorsubcode″.
        d) BISPDU error information (see 6.4 and 7.20)--this reports the data from the received BISPDU that will be used to diagnose the problem for the Notification. The parameter ″notificationBISpduerrorinfo″ will be used to report this information.

        OpenBISpduRDCError: generated when an OPEN BISPDU is received from another BIS in the same routeing domain, and the remote BIS is not a member of identically the same confederations as the local BIS. The significance sub-parameter of each item of additionalInformation shall be set to the value ′False′ (i.e., not significant) so that a managing system receiving the event report will be less likely to reject it. The probableCause shall be set to NLM.communicationsProtocolError. The perceivedSeverity shall be set to ′Minor′. A subsequent communicationsAlarm with a

perceivedSeverity value of 'Cleared' shall not be generated. No other fields or parameters shall be used, with the exception of further parameters in the AdditionalInformation field, as follows:

a) Remote BIS NET for this BIS-BIS connection--using the "notificationRemoteBIS-NET" parameter.
b) Remote BIS Routeing Domain Confederation (RDC) information using the "notificationRemoteRDCconfig" parameter.
c) Local BIS Routeing Domain Confederation (RDC) information using the "notificationLocalRDCconfig" parameter.

errorBISPDUconnectionclose: generated when an ERROR PDU has been received from a remote BIS. The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e., not significant) so that a managing system receiving the event report will be less likely to reject it. The probableCause shall be set to NLM.communicationsProtocolError. The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated. No other fields or parameters shall be used, with the exception of further parameters in the AdditionalInformation field, as follows:

a) RemoteBIS-NET for BIS-BIS connection--using the "notificationREMOTEBIS-NET" parameter
b) BISPDU error code (see 6.4 and 7.20)--this reports the error code that will be sent in the ERROR PDU using the parameter "notificationBISpduerrorcode".
c) BIS error subcode (see 6.4 and 7.20)--this reports the subcode that will be sent using the parameter "notificationBISerrorsubcode".
d) BISPDU error information (see 6.4 and 7.20)--this reports the data from the received BISPDU that will be used to diagnose the problem for the Notification. The parameter "notificatioNBISPUDerrorinfo" will be used to report this information.

CorruptAdjRIBIn: generated when the local method of checking the Adj-RIB-In has found an error. All Adj-RIBs-In are being purged. The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e., not significant) so that a managing system receiving the event report will be less likely to reject it. The probableCause shall be set to NLM.communicationsProtocolError. The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated. No other fields or parameters shall be used, with the exception of further parameters in the AdditionalInformation field, as follows:

a) MaxRIBIntegrityCheck attribute for this BIS
b) The remote BIS associated with this Adjacent RIB in the parameter "notificationRemoteBIS-NET".

PacketBomb: generated when the local BIS received a BISPDU other than an OPEN PDU, from an unknown BIS. The Source-BIS-NET is reported in the AdditionalInformation field using the "notificationSourceBIS-NET parameter. The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e., not significant) so that a managing system receiving the event report will be less likely to reject it. The probableCause shall be set to NLM.communicationsProtocolError. The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated. No other fields or parameters shall be used, with the exception of further parameters in the AdditionalInformation field, as follows. These parameters are created from the OPEN PDU values:

a) notificationSourceBISNET--NET of remote BIS sending packet bomb
b) notificationSourceBISrdi--RDI of remote BIS sending packet bomb
c) notificationSourceBISrdc--RDC information for remote BIS sending packet bomb

connectRequestBISUnknown: generated when the local BIS has received an OPEN BISPDU from an unknown BIS. The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e., not significant) so that a managing system receiving the event report will be less likely to reject it. The probableCause shall be set to NLM.communicationsProtocolError. The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated. No other fields or parameters shall be used, with the exception of further parameters in the AdditionalInformation field, as follows. These parameters are created from the OPEN PDU values:

a) notificationSourceBISNET--NET of remote BIS sending packet bomb
b) notificationSourceBISrdi--RDI of remote BIS sending packet bomb
c) notificationSourceBISrdc--RDC information for remote BIS sending packet bomb

EnterFSMStateMachine: generated when the IDRP FSM state machine used to communicate with another BIS is started. The RemoteBis-NET is reported in the additionalInformation field using the "notificationRemoteBIS-NET" parameter. The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e., not significant) so that a managing system receiving the event report will be less likely to reject it. The probableCause shall be set to NLM.communicationsProtocolError. The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated. No other fields or parameters shall be used, with the exception of further parameters in the AdditionalInformation field, as follows:

iDRPBasicImportedInfoNotifications-B
    BEHAVIOUR DEFINED AS Imports the communicationsInformation notification from ISO/IES 10165-2. It is used to report the following protocol events:

    EnterFSMState: generated when a BIS starts the IDRP FSM state machine to establish a connection with a remote BIS. The RemoteBis-NET is reported in the AdditionalInformation field using the "notificationRemoteBIS-NET" parameter. The significant subparameter of each item of AdditionalInformation shall be set to "false" (that is, not significant) so that a managing system receiving the event report will be less likely to reject it.

    FSMStateChange: generated when the IDRP FSM used to communicate with another BIS transitions from one state to another. The RemoteBis-NET is reported in the AdditionalInformation field using the "notificationRemoteBIS-NET" parameter. The significant sub-parameter of each item ofAdditionalInformation shall be set to "false" (that is, not significant) so that a managing system receiving the event report will be less likely to reject it.;;

maximumPDUSize ATTRIBUTE

WITH ATTRIBUTE SYNTAX IDRP.MaximumPDUSize;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR maximumPDUsize-B

BEHAVIOUR DEFINED AS The maximum number of octets that this BIS is able to handle in an incoming BISPDU;;

REGISTERED AS { IDRP.atoi maximumPDUsize(24) };

maxRIBIntegrityCheck ATTRIBUTE

WITH ATTRIBUTE SYNTAX IDRP.MaxRIBIntegrityCheck;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR maxRIBIntegrityCheck-B
BEHAVIOUR DEFINED AS The maximum time in seconds between checking of the Adj-RIBs-In by a local mechanism. If corrupt Adj-RIB-In is detected, the BIS shall purge the offending Adj-RIB-In;;
REGISTERED AS { IDRP.atoi maxRIBIntegrityCheck(25) };

maxRIBIntegrityTimer ATTRIBUTE

DERIVED FROM ″GMI″:timer;
BEHAVIOUR maxRIBIntegrityTimer-B
BEHAVIOUR DEFINED AS The timer that measures in seconds the time remaining until the Adj-RIBs-In must be checked by a local mechanism. If a corrupt Adj-RIB-In is detected, the BIS shall purge the offending Adj-RIB-In;;
REGISTERED AS { IDRP.atoi maxRIBIntegrityTimer(26) };

minRDOriginationTimer ATTRIBUTE

DERIVVED FROM ″GMI″:timer;
BEHAVIOUR minRDOriginationTimer-B
BEHAVIOUR DEFINED AS The timer that measures in seconds the time that has elapsed since the advertisement by the local BIS of an UPDATE PDU that reported changes within the local BIS's routeing domain. See clause 7.16.3.2;;
REGISTERED AS { IDRP.atoi minRDOriginationTimer(27) };

minRouteAdvertisementTimer ATTRIBUTE

DERIVED FROM ″GMI″:timer;
BEHAVIOUR minRouteSelectionTimer-B
BEHAVIOUR DEFINED AS The timer that measures in seconds the time that has elapsed since the advertisement by the local BIS of a better route that was received from a BIS located in another routeing domain. See clause 7.16.3.2. The minimum value is 5 seconds, and the maximum value is 1800 seconds;;
REGISTERED AS { IDRP.atoi minRouteSelectionTimer(28) };

multiExit ATTRIBUTE

WITH ATTRIBUTE SYNTAX IDRP.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR multiExit-B

BEHAVIOUR DEFINED AS The indication whether this BIS will use the MULTI_EXIT_DISC attribute to decide between otherwise identical routes. The multiExit parameter is used as the default value for the ″multi_exit_disc″ function in policy decisions.;;
REGISTERED AS { IDRP.atoi multiExit(29) };

outstandingPDUs ATTRIBUTE

WITH ATTRIBUTE SYNTAX IDRP.OutstandingPdus;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR outstandingPDUs-B
BEHAVIOUR DEFINED AS The maximum number of BISPDUs that may be sent to this BIS without receiving an acknowledgement;;
REGISTERED AS { IDRP.atoi outstandingPDUs(30) };

priority ATTRIBUTE

WITH ATTRIBUTE SYNTAX IDRP.Priority;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR priority-B
BEHAVIOUR DEFINED AS The lowest value of ISO 8473 priority parameter that this RD will provide for-warding services for;;
REGISTERED AS { IDRP.atoi priority(31) };

rdcConfig ATTRIBUTE

WITH ATTRIBUTE SYNTAX IDRP.Rdcgroup;
MATCHES FOR EQUALITY;
BEHAVIOUR rdcConfig-B
BEHAVIOUR DEFINED AS All of the Routing Confederations to which the RD of this BIS belongs and the nesting relationships that are in force between them. The nesting relationships are described as a sequence of sets of RDC Identifiers;;
REGISTERED AS { IDRP.atoi rdcConfig(32) };

rdLRE ATTRIBUTE

WITH ATTRIBUTE SYNTAX IDRP.Rdlre;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR rdLRE-B
BEHAVIOUR DEFINED AS A quantity that is proportional to the average error rate of a Routeing Domain and is expressed as an an integer in the range from 0 to $2^{32} - 1$. The actual error rate is equal to the integer value divided by $2^{32} - 1$.;;
REGISTERED AS { IDRP.atoi rdLRE(33) };

rdTransitDelay ATTRIBUTE

WITH ATTRIBUTE SYNTAX IDRP.RDTransitDelay;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR rdTransitDelay-B
BEHAVIOUR DEFINED AS The estimated average delay across a Routeing Domain in units of 2 ms.;;
REGISTERED AS { IDRP.atoi rdTransitDelay(35) };

retransmissionTime ATTRIBUTE

WITH ATTRIBUTE SYNTAX IDRP.RetransmissionTime;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR retransmissionTime-B
BEHAVIOUR DEFINED AS The Number of seconds of between KEEPALIVE messages if no other traffic is sent;;
REGISTERED AS { IDRP.atoi retransmissionTime(36) };

ribAttsSet ATTRIBUTE

WITH ATTRIBUTE SYNTAX IDRP.RibAttsSet;
MATCHES FOR EQUALITY;

    BEHAVIOUR ribAttsSet-B
        BEHAVIOUR DEFINED AS The set of Rib Attributes supported by this BIS.;;

routeServer ATTRIBUTE

    WITH ATTRIBUTE SYNTAX IDRP.Boolean;
    MATCHES FOR EQUALITY;
    BEHAVIOUR routeServer-B
        BEHAVIOUR DEFINED AS The indication whether this BIS may set the ″IDRP_Server_Allowed″ field in the
        NEXT_HOP attribute to X″FF″ for BIS to BIS UPDATE BISPDUs. If this variable is true then in accordance
        with local policy, the IDRP_Server_Allowed field may be set on some UPDATE BISPDUs that this BIS
        sends. If this attribute is set to false, then no UPDATE BISPDUs will be sent by this BIS with NEXT_HOP
        attributes containing an ″IDRP_Server flag″ equal to X″FF″.;;
