

Control Panel

There are three controls on the Control Panel:

Stop:

Stops the server. Use **Stop** when you need to do maintenance on server program files (such as adding patches or upgrades) or when you need to free system resources for other system maintenance.

Pause:

Suspends service. Use **Pause** when you need to temporarily interrupt service, but do not need to stop the server entirely. Pausing and continuing the server is much more efficient than stopping and starting the server.

Start/Continue:

Starts or continues the server. Use this control to restore service which has been interrupted by **Stop** or **Pause**.

Important information about the server's directory structure

This server is designed to work within a fixed directory structure. To ensure proper operation, do not rename or move the HTTPDOCS subdirectory, or move the server executable files to a different directory. You may relocate the entire directory tree if necessary, but be sure that you do not change its internal structure or move its program files to other directories.
