Using HTML.edit Help

HTML.edit Help
To display the Help Contents window, click on the ? icon found in the top right of the application window, or press Command-? at any time. Click on any underlined text ("HyperText") to navigate within Help. HTML.edit Help remembers all the topics you've browsed while the Help window is open -- typing Command-⛏ (Up Arrow) takes you in reverse order through those topics. Note that clicking on any underlined URL attempts to open it with your browser.

Balloon Help
Turning on Balloon Help (for System 7 users) provides balloons on many features of the editor.

Palette Help
Click on the question mark button found on the Tool palette to display Palette Help, a diagram showing the functions of the tool palette. See also Tool Palette.

Window Elements
Hold down the Option key, then click on the question mark button found on the Tool Palette to display a visual description of the elements of the HTML.edit document editing window.

Back to Project Strategy, on to HTML Help, or return to Contents.
