1.3 Introduction

INTRODUCTION

History

Future

RayStorm has been written to be as fast as possible, and use as less memory as possible. Thus we have implemented a octree algorithm, and optimized all calculations as much as we could.

Originally, RayStorm has been developed on Amiga using Maxon C++ $3.0\,$ Developer. The

What happened in the past?

What is planned for the future?

RayStorm Documentation

PC version

has been compiled with WATCOM C++ 10.5.

This demo version is limited to a resolution of 160x128.

The full version is unlimited. See {"register" link Register} how to register.

6 / 53

FUNDAMENTALS ABOUT RAYTRACING

General

Octree

Antialiasing

Depth of field

Soft shadows

Surfaces

Internals

Virtual Memory

Motion Blur

1.4 General

GENERAL

Raytracing makes it possible to generate fotorealistic pictures of objects.

A raytracer casts a ray form the position of the viewer through a scene and calculates the intersections with the objects in that scene. If a intersection is found, the raytracer decides which color the object at this position has. If the object is reflective or transparent, the raytracer casts new rays from this position and tests the intersections again and so on.

To make the surfaces of the objects more realistic, textures which simulate marble or clouds or water or other surfaces can be used.

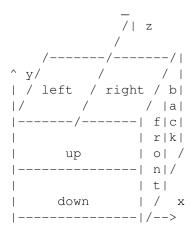

1.5 Octree

OCTREE

Simple raytracers determine the intersections with objects by testing all objects. This can lead to long rendering times if there are a lot of objects in the scene.

One solution of this problem is the Octree algorithm. This algorithm divides the scene in eight child-cells and every child-cell again in eight cells and so on until there are less than one objects in the cell or the maximum depth of the tree is reached.

Division of space with the octree algorithm:

1.6 Antialiasing

| super- | super- | super- | sampled| sampled|

ANTIALIASING

RayStorm uses a algorithm called 'Adaptive Supersampling' to do antialiasing. This algorithm cast for each pixel with a high contrast against it's four neighbours new rays which are close to the ray used for the pixel itself. The new color of the pixel is calculated with the supersampled pixels and the gaussian filter.

```
Supersampling is also used to do
           depth of field
           and
           soft shadows
           . So if
you want to use this features you have to set a antialiasing value greater
than one. (->
           ANTIALIAS
Example:
Settings: squareroot of number of samples per pixel: 3
|----|
| super- | super- |
| sampled| sampled| |
|---|---|---|
| super- | | super- |
| sampled| pixel | sampled|
|----|
```

RayStorm Documentation 8 / 53

|- Gaussian filter width -|

The rendering time increases dramatically if you use antialiasing. The values below depend on the contrast of the picture.

Samplesetting	rendering	time
1	x1	
2	x4	
3	x9	
4	x16	

Setting higher than 3 are not leading to significant better results.

1.7 Depth of field

DEPTH OF FIELD

Objects in computer graphics are normally rendered in an image plane using a pinhole camera model. That is to say, no matter how far or how near the objects are from the camera, they are always in sharp focus. Depth of field means that only objects at a certain distance from the camera lens are in sharp focus. Further and nearer objects produce a blurred image on the film plane.

[From 'Advanced Animation and Rendering Techniques']

To use depth of field you have to set $$\operatorname{\mathtt{ANTIALIAS}}$$

to a value bigger

than one.

Example for DOF

1.8 Soft shadows

SOFT SHADOWS

Real Light sources never have a zero size, therefore the shadows behind objects are never hard edged, they are soft. RayStorm generates this shadows by jittering the position of the light source. To use soft shadows you have to set

DISTRIB

to a value bigger than one.

1.9 Surfaces

RayStorm Documentation

9 / 53

SURFACES

Ambient (set with AMBIENT)

This determines the color of the object in sections which are in shadow.

Diffuse reflection (set with DIFFUSE)

The diffuse reflection falls off as the cosine of the angle between the normal and the ray to the light. Diffuse reflection determines the main color of the object (color in Imagine).

Specularly reflected highlights (set with SPECULAR)

Specularly reflected highlights fall off as the cosine of the angle between the reflected ray and the ray to the light source (specular in Imagine)

Specular reflection exponent (set with REFEXP)

Determines the size of the specularly reflected highlights, the higher the smaller the highlight (hardness in Imagine)

Diffuse transmission (set with DIFFTRANS)

Same as diffuse reflection, but only used if the lightsource is on opposite side of surface. Only applied if transucency is not 0.

Specular transmission (set with SPECTRANS)

Same as specular reflection, but only used if the lightsource is on opposite side of surface. Only applied if transucency is not 0.

Specular transmission exponent (set with TRANSEXP)

Same as specular reflection exponent, but only used if the lightsource is on opposite side of surface.

Specular transmittance (set with TRANSLUC)

Specular transmittance.

Transparency (set with TRANSPAR)

Transparent color (filter in Imagine).

Reflectivity (set with REFLECT)

Reflective color (reflect in Imagine).

Fog lenght (set with FOGLEN) (fog in Imagine).

Index of refraction (set with REFRINDEX)

Determines how the ray through transparent objects is refracted, the higher the more (index of refraction in Imagine).

RayStorm Documentation 10 / 53

Is calculated with the formula

index = -----lightspeed in vacuum

index = lightspeed in object

1.10 Internals

INTERNALS

Memory requirements

Triangle: 156 Bytes (flat shaded)

192 Bytes (Phong shaded)

Sphere: 70 Bytes Plane: 78 Bytes

Surface: 122 Bytes + length of name

Screenbuffer: 4 Bytes per pixel

Memory requirements of the octree depends on the scene.

1.11 Virtual Memory

VIRTUAL MEMORY

RayStorm has been tested successfully with VMM 3.1 from Martin Apel. If you want use RayStorm with virtual memory notice follwing hints:

- set Minimum VM allocation to 100 bytes if you define large scenes with many objects, because RayStorm only allocates small pieces of memory for single objects (less then 200 bytes). If you're loading Imagine objects RayStorm allocates big blocks of memory so you don't have to set Minimum VM allocation to 100.
- use a partition or a pseudo-partition for VMM, this is faster

1.12 Blur

MOTION BLUR

Motion blur is temporal anti-aliasing. In animated sequences, the normal rendering process functions like a camera that possesses an infinitely short exposure time and this eliminates the blurring of the image due to relative motion between an object and the film plane. When a series of images, generated without motion blur, is displayed as an animated sequence, the illusion of smooth motion is diminished by strobing effects. As human beings we expect to see loss of detail in moving images.

Motion blur is accounted for in distributed ray tracing by extending the distributed sampling and jittering into the time domain and computing a

solution that extracts information from the scen over the duration of the shutter exposure time. Objects are moved as required in the time period and visibility consequently changes over this time intervall. This method ensures that highlights and shadows are blurred or not, depending on the nature of the motion.

[From 'Advanced Animation and Rendering Techniques']

1.13 Requirements

REQUIREMENTS

- (1) You will need at least Kickstart 2.0.
- (2) 020+-version: 68020 processor and a mathematical coprocessor (68881/882 or internal 68040/060 version).
- (3) 000-version: 68000 processor (should even run on a Amiga 500 (not tested))
- (4) 512KB RAM minimum
- (5) RayStorm was written using MUI . So you need muimaster.library V2.0+ or later to run RayStorm.

recommended: 68030, 68882, Harddisk, GFX-Board

The faster the better :-).

Tested with:

A1200 68030/50, 6MB, 200MB HD

A2000 68040/30, 9MB, 250+250MB HD, Merlin Gfx-board

A2000 68030/14, 68882/20, 4MB, 730+52MB HD

A4000 68030/25, 68882/57, 4MB, 730+80MB HD

1.14 Features

FEATURES

- Up to 30% faster than Imagine (in trace mode).
- ARexx-port. RayStorm can be used by all programs with ARexx-port.
- Imagine compatible. RayStorm is designed to be almost compatible to Imagine. It can load Imagine objects and use Imagine textures.
- Octree algorithm used for rendering.
- Color, reflectivity, filter, altitude and specular mapping.
- Flat, cylinder and sphere mapping.
- Soft brush mapping.
- Mathematical textures: wood, marble, bumps, checker, linear, radial, stars.
- Tranparency and physically correct refractions.
- 8 levels of antialiasing (adaptive supersampling).
- Rendering box.

RayStorm Documentation 12 / 53

- Three builtin object types: sphere, plane and triangle.
- Three light types: ambient, point and spot.
- Depth of field with adjustable focal distance and aperture.
- Soft shadows.
- Backdrop picture.
- Global fog and foggy objects.
- Material attributes for realictic objects: ambient color, diffuse color, specular color, specular reflection exponent, diffuse transmission color, specular transmission color, specular transmission exponent, specular transmittance, transparent color, reflective color, index of refraction, foglength.
- Bright objects.
- Motion blur for realistic animations.
- Quick rendering.
- Global reflection map.
- Image formates: IFF-ILBM, PNG, TGA.
- Object format: Imagine-TDDD
- New image- and object-formats can be easily included because of the modular concept.

1.15 Installation

INSTALLATION

There is a installation script included in the archive which uses the Commodore Installer. Run it to install RayStorm.

1.16 ARexx Interface

AREXX INTERFACE

Introduction

RayStorm is completly controled through it's ARexx interface. We recommend that you have a look at the example script files in the 'ARexx' directory. These examples cover most of the features of RayStorm. We encourage you to create your own files and make them available for the public. You can send them to us and we might add them as an example files in the next version of RayStorm or we include them to our Homepage.

In one of the next versions of RayStorm we'll create a more powerful language, which has a similar syntax to C++.

It's the same if you write the commands in upper case or lower case. But it's important to enclose all commans in quotes because ARexx tries to interpret the line before it sends it to ARexx. It may happen that the line is changed and RayStorm don't do this what you want.

```
A typical structure of a scene file is:

/* title, comments, ... */

/* setting resolution, world, camera, lightsources */
```

```
'SETSCREEN 160 128'
'SETWORLD [0,0,0] [40,40,40]'
'SETCAMERA <0,0,80> <0,0,0> <0,1,0> 25 20'
'POINTLIGHT <10,-10,100> [255,255,255] SHADOW'
/\star define surfaces and actors \star/
'NEWSURFACE TEST1'
'AMBIENT [255,0,0]'
'DIFFUSE [255,0,0]'
'SPECULAR [255,255,255]'
'NEWSURFACE TEST2'
'AMBIENT [0,0,255]'
/* creating objects */
'SPHERE TEST1 <0,0,0> 10'
'SPHERE TEST2 <0,0,0> 10'
/* finally start to render the scene */
'STARTRENDER'
/* save the image */
'SAVEPIC "test.iff"'
'CLEANUP'
The parameters of a command can be FLOATs, INTEGERS, VECTORS, COLORS,
STRINGs, and IDENTIFIERs.
FLOAT
          An FLOAT is a floating point number with single precision
NUMBER
          A NUMBER is a simple integer number
          A VECTOR is embedded in ^{\prime}<^{\prime} ^{\prime}>^{\prime} and consists of three FLOATs
VECTOR
COLOR
          A COLOR is embedded in ^{\prime}[^{\prime}\ ^{\prime}]^{\prime} and consists of three INTEGERs
          with a range of 0 to 255
STRING
          A STRING consists of characters
KEYWORD
         An KEYWORD is a switch and consists of uppercase characters
Address
The ARexx-address of RayStorm is 'RAYSTORM'.
Parameter conventions:
  /S - Switch.
  /N - Number.
  /A - Required.
  All other numeric parameters are floating point numbers.

GENERAL AREXX-COMMANDS

ANTIALIAS

sets antialiasing parameters

RayStorm Documentation 16 / 53

```
BRUSHPATH
 sets brush path
CLEANUP
 cleanups scene
DISPLAY
 displays scene
DISTRIB
 sets parameters for distributive sampling
GETERRORSTR
 gets a error string for a given number
OBJECTPATH
 sets object path
POINTLIGHT
 creates point lightsource
QUIT
  quits RayStorm
SAVEPIC
 saves rendered picture
SETCAMERA
 sets camera parameters
SETSCREEN
 sets screen parameters
SETWORLD
 sets world parameters
SPOTLIGHT
 creates spot lightsource
STARTRENDER
 starts rendering
TEXTUREPATH
 sets texture path
WINTOFRONT
 brings window to front
```

1.18 antialias

ANTIALIAS

Template:
 SAMPLES/N/A, WIDTH, CONTRIB

RayStorm Documentation 17 / 53

```
Arguments:

NUMBER SAMPLES

squareroot of number of samples per pixel (max. 8)

FLOAT WIDTH

width of gaussian filter

COLOR CONTRIB

max. allowed contrast

Description:

Sets antialiasing parameters (see

Antialiasing
)

Default:

ANTIALIAS 1 1.3 [51,38,76]
```

1.19 brushpath

```
BRUSHPATH

Template:
PATH/A

Arguments:
STRING PATH
pathname (format: 'path1;path2;...;pathn')

Description:
Defines the path where to search brushes.
```

1.20 cleanup

```
CLEANUP

Template:
  none
Arguments:
  none
Description:
  Deletes all defined objects, lightsources, surfaces and actors
```

1.21 display

```
!!! CAUTION !!!
THIS COMMAND ISN'T RELEASED IN THIS VERSION YET
!!! CAUTION !!!

Template:
  FLOYD/S
Arguments:
  KEYWORD FLOYD/S
    dither with Floyd-Steinberg algorithm
```

RayStorm Documentation 18 / 53

```
Description:
Displays rendered pic on screen
```

1.22 distrib

```
Template:
    SAMPLES/N, SOFTSHADOW/N
Arguments:
    NUMBER SAMPLES/N
        squareroot of number of samples per pixel for motionblur
    NUMBER SOFTSHADOW/N
        squareroot of number of samples per pixel for softshadows
Description:
    Sets number of samples per pixel for distributive sampling (used for and )
Default:
    DISTRIB 1,1
```

1.23 geterrorstr

GETERRORSTR

Description:

```
Template:
ERRNUM/N/A
Arguments:
NUMBER ERRNUM
error number
```

Returns the error string for the given error number

1.24 objectpath

```
OBJECTPATH

Template:
   PATH/A

Arguments:
   PATH
      pathname (format: 'path1;path2;...;pathn')

Description:
   Defines the path where to search Imagine objects.
```

1.25 pointlight

RayStorm Documentation 19 / 53

POINTLIGHT

```
Template:
POS, COLOR, SIZE, SHADOW/S, ACTOR, FALLOFF
Arguments:
 VECTOR POS
   position
 COLOR COLOR
   color of light
 VECTOR SIZE
   size of light source (used for
                soft shadows
 KEYWORD SHADOW/S
   cast shadows if keyword given
 STRING ACTOR
   name of actor
FLOAT FALLOFF
   distance where the brightness of the light is zero
Description:
Creates a point lightsource
Default:
POINTLIGHT <0,0,0> [255,255,255] 0 ?? ?? 0
```

1.26 quit

QUIT

Template:
none
Arguments:
none
Description:
Quits Raystrom

1.27 savepic

SAVEPIC

```
Template:
NAME/A,FORMAT
Arguments:
STRING NAME
name of file to save
STRING FORMAT
image format (default ILBM)
Description:
Saves rendered picture. If an error occures the command returns an error string.
```

RayStorm Documentation 20 / 53

1.28 setcamera

SETCAMERA

```
Template:
POS/A, VIEWPOINT, VIEWUP, FOVX, FOVY, FOCALDIST, APERTURE, POSACTOR, VIEWACTOR
Arguments:
 VECTOR POS
  position
 VECTOR VIEWPOINT
  viewpoint
 VECTOR VIEWUP
  viewupvector
 FLOAT FOVX, FOVY
  field of view (in degree) (20 degree creates camera like Imagine
  default camera)
 FLOAT FOCALDIST
   distance from eye to focal plane
 FLOAT APERTURE
   aperture width (0 = pinhole) (->
                depth of field
                )
 STRING POSACTOR
  name of position actor
 STRING VIEWACTOR
  name of point of view actor
Description:
 Sets the parameters of the camera
Default:
 SETCAMERA <0,0,-10><0,0,0><0,1,0> 45 45 1. 0.
```

1.29 setscreen

```
Template:
RESX/N/A,RESY/N/A,COLORS/N
Arguments:
NUMBER RESX, RESY
resolution
NUMBER COLORS
number of colors (not yet implemented)
Description:
Sets the screen parameters. Note that in the demo-version the resolution is limited to 160x128!
Default:
SETSCREEN 128 128 32
```

1.30 setworld

SETWORLD

RayStorm Documentation 21 / 53

```
Template:
 BACK/A, AMBIENT, RANDJIT/S, BACKDROP, FOGLEN, FOGHEIGHT, FOGCOLOR, REFLMAP
Arguments:
 COLOR BACK
   backgroundcolor
 COLOR AMBIENT
   ambientcolor
 KEYWORD RANDJIT
  use random jitter for
                depth of field
                 and
                soft shadows
                 STRING BACKDROP
   name of backdrop picture
 FLOAT FOGLEN
   global fog length
 FLOAT FOGHEIGHT
   highest fog y-coordinate
 COLOR FOGCOLOR
   fogcolor
 STRING REFLMAP
  name of reflection map
Description:
 Sets world parameters
Default:
 SETWORLD [0,0,0] [0,0,0] ?? 32 0 [255,255,255]
```

1.31 spotlight

SPOTLIGHT

```
Template:
POS, COLOR, LOOKPOINT, ANGLE, SIZE, SHADOW/S, ACTOR, LOOKP_ACTOR, FALLOFF
Arguments:
 VECTOR POS
   position
 COLOR COLOR
   color
 VECTOR LOOKPOINT
   lookpoint
 FLOAT ANGLE
   opening angel (in degree max. 180)
 FLOAT SIZE
   size of light source (used for
                soft shadows
 KEYWORD SHADOW
   cast shadows if keyword given
 STRING ACTOR
  name of position actor
 STRING LOOKP_ACTOR
  name of lookpoint actor
 FLOAT FALLOFF
   distance where the brightness of the light is zero
Description:
```

```
Creates a spot lightsource. The rays emitted from a spotlight are constrained by a cone. The LOOKPOINT vector gives the center of the illuminated area.

Default:

SPOTLIGHT <0,0,0> [255,255,255] <0,0,1> 45 0 ?? ?? ?? 0
```

1.32 startrender

STARTRENDER

```
Template:
 QUICK/S, DEPTH/N, FROM, TO/N, LEFT/N, TOP/N, RIGHT/N, BOTTOM/N
Arguments:
KEYWORD QUICK
  render quick (no shadows, reflections and transparency)
 NUMBER DEPTH
   depth of generated octree (default 3)
 FLOAT FROM, TO
   time code (default 0,0). If you want
                motion blur
                 you have to
   set FROM and TO to different values, if not only set FROM.
 NUMBER LEFT, TOP, RIGHT, BOTTOM
   coordinates for rendering box. Picture is renderd only inside of
  rectangle.
Description:
 Starts rendering process. If you set QUICK shadows, reflections and
 transparency are not calculated. In very complex scenes it is useful to
 increase the octree depth in order to reach a better performance during
 the rendering process. But this can only be done with enough memory!
```

1.33 texturepath

TEXTUREPATH

```
Template:
    PATH/A
Arguments:
    PATH
    pathname (format: 'path1;path2;...;pathn')
Description:
    Defines the path where to search textures.
```

1.34 wintofront

WINTOFRONT

Template:
none
Arguments:

RayStorm Documentation 23 / 53

```
none
Description:
Brings RayStorm window in front
```

1.35 ARexx-commands for creating objects

```
LOADOBJ
loads an Imagine TDDD-file

PLANE
creates a plane (ground in Imagine)

SPHERE
creates a sphere

TRIANGLE
creates a triangle
```

AREXX-COMMANDS FOR CREATING OBJECTS

1.36 loadobj

```
LOADOBJ
Template:
NAME/A, POS, ALIGN, SCALE, ACTOR
Arguments:
 STRING NAME
   filename
VECTOR POS
  position
 VECTOR ALIGN
  alignment (in degrees)
 VECTOR SCALE
  scaling
 STRING ACTOR
  name of actor
Description:
Loads an Imagine TDDD-file object with attributes, brushes and textures.
Where to get Imagine object files?
Look on FTP-servers which support AMINET. For example try out
 ftp.uni-paderborn.de
 Path: ftp/aminet/pub/gfx/3dobj/
Default:
LOADOBJ ??? <0,0,0> <0,0,0> <1,1,1>
```

1.37 plane

RayStorm Documentation

PLANE

Template:
SURF/A,POS,NORM,ACTOR
Arguments:
STRING SURF
surface name
VECTOR POS
position
VECTOR NORM
normal
STRING ACTOR
name of actor
Description:
Creates a infinite plane
Default:
PLANE ??? <0,0,0> <0,1,0>

1.38 sphere

SPHERE

Template:
SURF/A,POS/A,RADIUS/A,ACTOR
Arguments:
STRING SURF
surface name
VECTOR POS
position
FLOAT RADIUS
radius
STRING ACTOR
name of actor
Description:
Creates a sphere

1.39 triangle

TRIANGLE

Template:
SURF/A,P1/A,P2/A,P3/A,N1,N2,N3,ACTOR
Arguments:
STRING SURF
surface name
VECTOR P1
first point
VECTOR P2
second point
VECTOR P3
third point

VECTOR N1
first normal
VECTOR N2
second normal
VECTOR N3
third normal
STRING ACTOR
name of actor
Description:

Creates a triangle with corners at position P1, P2 and P3. If you specify the normals, a phong shaded triangle otherwise a flat triangle is created. Computing the normals by hand is a difficult task, and should be done by utility programs.

1.40 ARexx-commands for setting attributes

AREXX-COMMANDS FOR SETTING ATTRIBUTES

Every object must have a surface definition. With the following commands you can set the attributes of a surface. First you have to define the current surface with 'NEWSURFACE <name>'. Raystorm will set the attributes of the new surface to default values. Every following command such as AMBIENT or DIFFTRANS refers to the current surface and will override the corresponding default values.

The following examples define two surfaces:

NEWSURFACE RED AMBIENT [255,0,0] DIFFUSE [255,0,0]

NEWSURFACE WATER DIFFUSE [0,0,255] REFRINDEX 1.333

List of surface commands:

NEWSURFACE creates a new surface

AMBIENT sets ambient color

BRUSH adds a brush

DIFFTRANS sets diffuse transmission color

DIFFUSE sets diffuse color

FOGLEN sets the foglength

RayStorm Documentation 26 / 53

```
IMTEXTURE
  adds a Imagine texture
REFEXP
 sets the specular reflection exponent
REFLECT
 sets the specular reflectivity
REFRINDEX
 sets the index of refraction
SPECTRANS
 sets the specular transmission
SPECULAR
 sets the specular color
TRANSEXP
  sets the specular transmission exponent
TRANSLUC
 sets the specular transmittance
TRANSPAR
  sets the diffuce transmittance
```

1.41 ambient

AMBIENT

Template:
 COLOR/A
Arguments:
 STRING COLOR
 color
Description:
 Sets the ambient color of surface
Default:
 AMBIENT [255,255,255]

1.42 brush

BRUSH

```
Template:
   NAME/A, TYPE/A, WRAP/A, POS/A, ALIGN/A, SIZE/A, REPEAT/S, MIRROR/S, SOFT/S, ACTOR
Arguments:
   STRING NAME
   name of brush file
   KEYWORD TYPE [COLOR|REFLECT|FILTER|ALTITUDE|SPECULAR]
   Brush type
```

```
KEYWORD WRAP [FLAT|WRAPX|WRAPY|WRAPXY]
  Brush wrapping method
 VECTOR POS
  position
 VECTOR ALIGN
   alignment
 VECTOR SIZE
   size of brush
 KEYWORD REPEAT
   if set brush is repeated like a tile
 KEYWORD MIRROR
   if set brush is mirrord
 KEYWORD SOFT
   if set brush color is softly interpolated
 STRING ACTOR
  name of actor
Description:
 Adds a brush to surface. A brush is a bitmap which is wrapped around an
 object. The specified file will be searched for in the current directory.
 If not found and a brushpath is given, the file will be searched there.
 If an error occures the command returns an error string.
 Constants for type:
 COLOR
 Replaces the surface color of the object with the image (sets
                DIFFUSE
                 and
                AMBIENT
                ) .
 REFLECT
 Map covers the surface and reflects environment (see
                REFLECT
                )).
 FILTER
  Uses the white color to pass colors and the black area to hold back color
  with a variance between two colors (see
                TRANSPAR
                ) .
 ALTITUDE
  The red values of the brush are used to give the surface an appearence of
  bumpiness.
 SPECULAR
  The rgb values set the specular color of the surface (see
                SPECULAR
                ) .
 Constants for wrap:
  The brush is projected to X-Y plane, the axis is in the middle of the
 brush area, length is the distance from the middle to the border.
 WRAPX
  The brush is wrapped around the x-axis, like on a cylinder. The left edge
  of the brush begins at the posititve X axis and wraps the brush around
  the cylinder from 'west' to 'east'.
 WRAPY
  Same as WRAPX, but wrapping is around the y-axis.
```

RayStorm Documentation 28 / 53

WRAPXY

Wrapping both: around X and Y axis. It is assumed, that the object is a sphere. The Y axis is the north/south pole of the spherical mapping. The left edge of the brush begins at the positive X axis and wraps the brush around the sphere from 'west' to 'east'. The brush covers the sphere exactly once.

1.43 difftrans

DIFFTRANS

Template:

COLOR/A

Arguments:

COLOR COLOR

color

Description:

Sets the diffuse transmission color of surface. Same as diffuse reflection, but only used if the lightsource is on opposite side of surface. Only applied if transucency is not set to zero.

Default:

DIFFTRANS [0,0,0]

1.44 diffuse

DIFFUSE

Template:

COLOR/A

Arguments:

COLOR COLOR

color

Description:

Sets the diffuse color of surface. The diffuse reflection falls off as the cosine of the angle between the normal and the ray to the light. Diffuse reflection determines the main color of the object (color in Imagine).

Default:

DIFFUSE [255,255,255]

1.45 foglen

FOGLEN

Template:
 VALUE/A
 Arguments:
 FLOAT VALUE/A
 foglength
 Description:

```
Sets the foglength of the surface. Fog color is set with $\operatorname{TRANSPAR}$ . Default: FOGLEN 0
```

1.46 imtexture

```
IMTEXTURE
Template:
NAME/A, POS, ALIGN, SIZE, P1, P2, P3, P4, P5, P6, P7, P8, P9, P10, P11, P12, P13, P14, P15, P16, ←
    ACTOR
Arguments:
 STRING NAME
   name of Imagine texture file
 VECTOR POS
   position
 VECTOR ALIGN
   alignment
 VECTOR SIZE
   size of texture axis
 FLOAT P1, P2, P3, P4, P5, P6, P7, P8, P9, P10, P11, P12, P13, P14, P15, P16
   texture parameters
 STRING ACTOR
  name of actor
Description:
Adds a Imagine texture to surface
Default:
defaults are taken from texture if not all paramters are given
```

1.47 newsurface

NEWSURFACE

```
Template:
NAME/A,BRIGHT/S
Arguments:
STRING NAME
name
KEYWORD BRIGHT
if set the brightness of the surface is everywhere the same
Description:
```

Creates a new surface with name 'NAME'

1.48 refexp

REFEXP

Template:

RayStorm Documentation 30 / 53

```
VALUE/A
Arguments:
FLOAT VALUE
specular reflection exponent
Description:
Sets the specular reflection exponent of surface. Determines the size of the specularly reflected highlights, the higher the smaller the highlight (hardness in Imagine).
Default:
REFEXP 12.
```

1.49 reflect

REFLECT

Template:
COLOR/A

Arguments:
COLOR COLOR
color

Description:
Sets the specular reflectivity of surface
Default:
REFLECT [0,0,0]

1.50 refrindex

```
REFRINDEX
Template:
VALUE/A
Arguments:
FLOAT VALUE
  index of refraction
Description:
Sets the index of refraction of surface. Determines how the ray is refracted
through transparent objects, the higher the more (index of refraction in
Imagine).
Default:
REFRINDEX 1.
Examples:
MATERIAL
                          Index
Vacuum ..... 1.00000 (exactly)
Air (STP)..... 1.00029
Acetone ..... 1.36
Alcohol ..... 1.329
Amorphous Selenium ..... 2.92
Calspar1 ..... 1.66
Calspar2 ..... 1.486
Carbon Disulfide ..... 1.63
```

Chromium Oxide	2.705
Copper Oxide	2.705

1.51 spectrans

SPECTRANS

Template:
 COLOR/A
Arguments:
 COLOR COLOR

color
Description:

Sets the specular transmission color of surface. Same as specular reflection, but only used if the lightsource is on opposite side of surface. Only applied if transucency is not 0.

Default:

SETSPECTRANS [255, 255, 255]

1.52 specular

SPECULAR

Template: COLOR/A

RayStorm Documentation 32 / 53

```
Arguments:
COLOR COLOR
color
Description:
Sets the specular color of surface. Specularly reflected highlights fall
off as the cosine of the angle between the reflected ray and the ray to the
light source (specular in Imagine).
Default:
SPECULAR [255,255,255]
```

1.53 transexp

```
TRANSEXP

Template:
VALUE/A

Arguments:
FLOAT VALUE
   specular transmission exponent

Description:
Sets the specular transmission exponent of surface. Same as specular reflection exponent, but only used if the lightsource is on opposite side of surface.

Default:
TRANSEXP 12.
```

1.54 transluc

TRANSLUC

Template:
 VALUE/A
Arguments:
 FLOAT VALUE
 specular transmittance
Description:
 Sets the specular transmittance of surface
Default:
 TRANSLUC 0

1.55 transpar

TRANSPAR

Template:
 COLOR/A
Arguments:
 COLOR COLOR
 color
Description:

RayStorm Documentation 33 / 53

```
Sets the diffuse transmittance of surface Default: TRANSPAR [0,0,0]
```

1.56 ARexx-commands for animation control

RayStorm Documentation 35 / 53

1.61 ARexx-errors

AREXX-ERRORS

These values are returned when something went wrong, you can get the error string with the command $% \left(1\right) =\left(1\right) +\left(1\right)$

GETERRORSTR

Application and parser errors

Here are the errors returned from the command parser and the application itself.

10 Wrong screen resolution

Both components of the screen resolution have to be higher than one.

11 Actor not defined

The specified actor name does not exist.

12 Surface not defined

The specified surface name does not exist.

13 Not enough memory

Allocation of memory failed.

14 Limitations of demo version reached

The demo version is limited to a resolution of 160x128.

15 Unknown brush mapping type

You specified a unknown mapping method for the

BRUSH

command.

16 Unknown brush wrapping method

You specified a unknown wrapping method for the

BRUSH

command.

17 Depth of octree too big (max. 6)

The octree depth is limited to a depth of 6.

18 Invalid time intervall

One component of a time intervall was negative or the beginning time was later than the end.

19 Antialiasing value too big (max. 8)

The value of the

ANTIALIAS

command is limited to 8.

20 Distribution value too big (max. 8)

The value of the

DISTRIB

command is limited to 8.

21 Unknown interpolation method

You specified a unknown interpolation method for the

POSITION

,

ALIGNMENT

or

SIZE

command.

22 No picture renderd

There is no picture for

SAVEPIC to save because you renderd none or called CLEANUP before. 23 Can't open screen The DISPLAY command was unable to open the screen (!!! THIS COMMAND ISN'T RELEASED IN THIS VERSION YET !!!). Can't open iffparse.library 24 RayStorm failed to open iffparse.library (at least version 37 is needed) 25 Can't open graphics.library RayStorm failed to open graphics.library (at least version 33 is 26 Can't open intuition.library RayStorm failed to open intuition.library (at least version 37 is needed) 27 Can't open window RayStorm failed to open the window. 28 Can't open muimaster.library RayStorm failed to open muimaster.library (at least version 8 is needed) 29 Invalid vector definition The specified vector has the wrong format (must be ' < x, y, z > '). 30 Invalid color definition The specified color has the wrong format (must be '[r,g,b]'). Invalid region definition 31 The specified region is out of range. Internal errors This are errors of the renderer. 101 Not enough memory Allocation of memory failed. 102 Error in triangle definition It's impossible to generate a triangle with the specified coordinates (see TRIANGLE 103 The view and up directions are identical? You specified a view-up-vector for the CAMERA command which is identical to the view direction. 104 Not enough memory for screen buffer The allocation of the screen buffer failed. 105 The backdrop picture has the wrong size The backdrop picture must have the same resolution as the with SETSCREEN specified screen resolution. 106 Can't open Imagine TDDD file RayStorm failed to open the specified Imagine TDDD file, check filename and path. Error reading TDDD file 107 An error occured while RayStorm read a Imagine TDDD file, maybe it

RayStorm Documentation 37 / 53

was no TDDD file.

108 Can't open Imagine texture file
RayStorm failed to open the specified Imagine texture file, check
filename and path.

- 109 Can't open brush file
 RayStorm failed to open the specified brush file, check
 filename and path.
- 110 Error initializing Imagine texture

 An error occured as RayStorm tried to initialize a Imagine texture.
- 111 Can't open picture
 RayStorm failed to open the specified picture file, check filename
 and path.
- 112 Error reading picture
 An error occured while RayStorm read a picture file.
- Can't open typefile

 RayStorm failed to open the typefile. The typefile is needed to identify the filetypes of the pictures and objects. The file 'modules/pictures/types' or 'modules/objects/types' can't be opened.
- 114 Error reading typefile

 An error occured while RayStorm read a typefile, maybe the file is damaged.
- Unknown picture format
 RayStorm was unable to recognize the format of the picture file.
- 116 An error occcured while invoking picture handler The used picture handler returned a error.

1.62 Examples

EXAMPLES

We have included several demos in the directories 'rexx' and 'examples' to show how to use RayStorm.

In the 'arexx' directory are examples scripts which show the usage of RayStorm with ARexx. Start them simply by typing 'rx ???.ray' in a shell (???.ray is the name of the script).

Attrtest.ray

Several examples for attributes.

Attrtest1.ray

Several examples for attributes.

Backdrop.ray

Demonstrates usage of backdrop picture.

Bounce.ray

Tutorial

Brush.ray

Demonstrates usage of brush mapping.

Bump.ray

Test of bump texture.

Checker.ray

Test of checker texture.

Chess.ray

Chess scene.

Coin.ray

Jumping coin with motion blur.

Dof.ray

Test of depth of field.

Eight.ray

Billard scene.

Fog.ray

Fog demonstration.

Fog1.ray

Fog demonstration.

Im_texture.ray

Example for usage of Imagine textures.

Marble.ray

Test of marble texture.

Randomsphere.ray

Randomly colored sphere.

Simple.ray

Tutorial

.

Supersample.ray

Demonstrates adaptive supersampling.

Title.ray

Renders the RayStorm title.

Title1.ray

Renders the RayStorm title.

Wood.ray

Test of wood texture.

In the 'examples' directory are C-programs which show the usage of RayStorm directly with a program. They can only be run from a shell. These programs are producing a couple of pictures no animation, which must be glued together with a utility like MainActor.

Sphanim

Animation of several spheres which jump over a checker board. Camera

RayStorm Documentation 39 / 53

follows them.

Worldanim

Rotating world.

1.63 Tutorials

TUTORIALS

Simple scene

Bouncing ball

1.64 Simple scene

Tutorial: Simple scene

Now we will create a very famous scene. A sphere over a checkerboard! This might be boring, but it's good for the absolute beginner to get an impression of building a scene.

Here we go:

- 1. In the drawer 'ARexx' of the RayStorm directory there is a file named 'default.ray'. This is a default form for RayStorm ARexx scripts. You can use this form to write your own scripts. We'll use this file as a default for our animation script. Copy this file to the file 'simple.ray'. After this load the file 'simple.ray' to your favorite text editor (e.g GoldEd or CygnusEd).
- 2. To view the scene, we need a camera. Insert after the command 'ADDRESS RAYSTORM' the lines:

```
SETCAMERA
<6,1.5,-1.5> <0,0,0> <0,1,0>'
```

This sets the camera to position <6,1.5,-1.5>. The camera points to <0,0,0> and the view-up vector is <0,1,0>. Note that you don't have to specify every single parameter. Every command has default values. Refer to the description of a command to find out the default values.

3. Nothing can be seen without a lightsource.
Type:

```
POINTLIGHT <0,50,0> [255,255,255] SHADOW'
```

The sphere is illuminated from above with white light.

```
4. Before placing the objects in the scene, you have to define their
  surfaces.
  Type:
                NEWSURFACE
                 planesurf'
  This creates a surface with name planesurf. The plane has a checkered
  surface, so type:
                IMTEXTURE
                 /textures/checker.itx <0.1,0.1,0.1> <0,0,0> <2,2,2>'
5. That was the plane texture. Let 's go over to sphere texture.
  Type:
                NEWSURFACE
                 spheresurf'
  The sphere has a mirrored surface. To simulate a perfect mirror, type
                REFLECT
                 [255, 255, 255]'
6. Now we can add the objects to the scene:
   ,
                SPHERE
                 spheresurf <0,0.5,0> 1'
  This creates a sphere on position <0,0.5,0> and radius 1.
  Add the plane:
                PLANE
                 planesurf'
  The default values for the position and the normal vector fit to our
  scene, so we can take them over.
7. Let's make an end to the definitions and render the scene!
  Type:
                STARTRENDER
8. Finally we may not forget to save the picture, so add:
                SAVEPIC
                 simple.iff'
```

which will save the renderd picture in the current directory as a $\ensuremath{\mathsf{IFF}}\xspace-\ensuremath{\mathsf{ILBM}}$ file.

The last step is to free all the memory with the command 'CLEANUP'. Add:

CLEANUP

9. Start the script from a shell-window with the sequence 'rx simple.ray'.
RayStorm will now generate your picture. When RayStorm finished the work
start your favourite viewer-program, load the file and have a look at
it.

Looks very monochrome!!

To make the world colorful, we make a red checker and set the sky to blue. A blue sky can be done by setting the world's background color.

10. Before 'SETCAMERA' type:

SETWORLD [30,30,255]'

DIFFUSE [155,0,0]'

to the surface planesurf (this defines one checker color), the other one must be set in the 'IMTEXTURE' command, so change it to

'IMTEXTURE checker.itx <0.1,0.1,0.1> <0,0,0> <2,2,2> 255 0 0'

(Note that '255 0 0' describes a color, but is not embedded in <>, because the checker color belongs to the texture parameters which are all floats.)

11. Render the scene once again, and view it.

That's the end of the tutorial! Make some changes to the scene file and play around with the parameters to see their effects.

1.65 Bouncing ball

Tutorial: Bouncing ball

The goal of this tutorial is to show you how to generate little animations. At the end of this tutorial you'll have a animation where the earth rotates and bounces on a rotating plane with a white checker texture on the top and a red checker on the bottom. If you have a fast computer you can also generate the animation with motion blur.

O.k. here we go:

1. In the drawer 'ARexx' of the RayStorm directory there is a file named

'default.ray'. This is a default form for RayStorm ARexx scripts. You can use this form to write your own scripts.

We'll use this file as a default for our animation script. Copy this file to the file 'bounce.ray'. After this load the file 'bounce.ray' to your favorite text editor (e.g GoldEd or CygnusEd).

2. First we define some values: the acceleration of the ball and the amount of frames to generate.

RayStorm has three commands to set the paths where it searchs the files it needs. We use a brush for the surface of the ball and a texture for the surface of the ground.

To do this we have to insert after the command 'ADDRESS RAYSTORM' the lines:

It's the same if you write the commands in upper case or lower case. But it's important to enclose all commans in quotes because ARexx tries to interpret the line before it sends it to ARexx. It may happen that the line is changed and RayStorm don't do this what you want.

3. Next we set the screen resolution. For the first experiments we choose a low resolution of 160×128 pixels. Insert the line:

SETSCREEN
160 128'

/textures'

4. Now we set the camera parameters. The first three values determine the position of the camera. We want to place it so that we can see the ball all over the time. The next values set the viewpoint of the camera, this is the point the camera aims to. The next values determine the view up vector. And the last two values determine the field of view. To get a pixel aspect of 1:1 we have to set them to 25 and 20 degree.

SETCAMERA
0 10 40 0 5 0 0 1 0 25 20'

5. We want to have a bright blue background for our animation. The background and the global ambient color is set with the 'SETWORLD' command. We want to set the ambient color to a dark gray, if this color is to bright the scene will look washed out and the objects appear flat. Insert the line:

SETWORLD 10 30 200 10 10 10'

```
6. The illumination is an important part of a scene. We want to place a
  pointlight near the camera. Add the line:
                POINTLIGHT
                 5 10 50'
7. Now we define the actor for the plane. We want to rotate it around the
   Z-axis. Insert the lines:
                NEWACTOR
                 groundactor'
                ALIGNMENT
                 0 ' frames+2 ' 0 0 360'
7. Now we define the surface for the plane and the plane itself. We make it
   a little reflective an apply a checker texture. The surface 'groundtop'
   is for the top of the plane and the surface 'groundbottom' is for the
   bottom of the surface. The plane itself consits of four triangles. Two
   fo the to and two for the bottom. Insert the lines:
                NEWSURFACE
                 groundtop'
                DIFFUSE
                 255 255 255'
                SPECULAR
                 0 0 0'

8. Next we define the motion of the ball. It starts at a height of 10 and
  accelerates until it bounces on the plane, changes it's direction and
  the motions ends as the ball is back at he start point. Additional the
  ball rotates around the Y-axis. Add the following sequence to your script:
  speed = -g
  pos = 10
                NEWACTOR
                ballactor 0 'pos' 0'
  do i=0 to frames
                POSITION
                 ' i i+1 0 pos 0
    pos = pos + speed
    if pos<=1 & speed<0 then
       speed = -speed
    else
       speed = speed-g
  end
                ALIGNMENT
                 0 ' frames+2 ' 0 360 0'
9. Now we define the surface for the ball and the ball itself. The only thing
  we must do is to map a earth styled brush map to a sphere. To reach this
  goal the position of the brush must be set to the middle of the sphere
  and the size must be small enough to be completely inside the sphere.
 This are the lines to define the ball:
                NEWSURFACE
                ball'
                 earth.iff COLOR WRAPXY 0 0 0 0 0 .1 .1 .1 ACTOR ballactor'
                SPHERE
                ball 0 10 0 1 ACTOR ballactor'
10. If your computer is fast enough you can insert the follwing lines:
                ANTIALIAS
                 1'
                DISTRIB
```

1'

'ANTIALIAS' improves the quality of the picture; 2 or 3 are normal values, higher values don't improve the qulity significant.

A value higher than one for 'DISTRIB' switches {"motion blur" link Motion Blur} \hookleftarrow on.

11. At this the we have finished the definitions and now can render the single frames. If youn want the reflections of the ball on the plane you have to delete the keyword 'QUICK', because RayStorm renders no reflections in quick mode. The frame time is set with 'FROM' and 'TO'. We save the frames as IFF-ILBM pictures with the names 'bounce0001.iff' ... 'bounceXXXX.iff'. The last step is to free all the memory with the command 'CLEANUP'. Add these lines:

12. Start the script from a shell-window with the sequence 'rx bounce.ray'. RayStorm will now generate your frames. When RayStorm finished the work you must glue the pictures together to get the animation.

That's all. Have fun!

1.66 Tips&Tricks

Tips&Tricks

- It's faster not to use planes in scenes with motion blur.

1.67 Textures

TEXTURES

Textures are mathematical generated patterns which can be applied to the surface of a object.

There are several textures in the directory 'textures'.

Bump

Checker

Linear

Marble

Radial

Stars

Wood

1.68 **Bump**

BUMP

This texture applies a bumps to the surface. Size of texture determines size of bumps.

Parameters:

X bump size - Y bump size - Z bump size
Sets the 'depth' of the bumps.

Example:

IMTEXTURE bump.itx <0,0,0> <0,0,0> <.002,.002,.002> 1 1 1

Picture

1.69 Checker

CHECKER

This texture applies a normal checks pattern to the surface. Attention!

If you apply a checker texture to a plane, the plane may not be at the same position on which the checker changes its color. Otherwise you get a noisy texture due to rounding errors.

Parameters:

Color Red - Color Green - Color Blue Color of the checks, other color is taken from object.

Reflect Red - Reflect Green - Reflect Blue Reflect color of the checks.

Filter Red - Filter Green - Filter Blue Filter color of the checks.

Example

1.70 Linear

LINEAR

This texture varies the color of the object in the y-direction of the texture.

Parameters:

Color Red - Color Green - Color Blue Color to interpolate to.

Reflect Red - Reflect Green - Reflect Blue Reflect to interpolate to.

Filter Red - Filter Green - Filter Blue Filter to interpolate to.

Example

1.71 Wood

WOOD

This texture applies a wood like texture to the surface. Size of texture determines size of wood.

Parameters:

Color Red - Color Green - Color Blue Color. Other color is taken from object.

Reflect Red - Reflect Green - Reflect Blue Reflect color.

Filter Red - Filter Green - Filter Blue Filter color.

Octave

The higher the octave the noisier are the wood rings.

Frequency

The higher the frequency the smaller the wood rings.

Example

1.72 Marble

MARBLE

This texture applies a marble like texture to the surface. Size of texture determines size of bumps.

RayStorm Documentation 48 / 53

Parameters:

Color Red - Color Green - Color Blue Color. Other color is taken from object.

Reflect Red - Reflect Green - Reflect Blue Reflect color.

Filter Red - Filter Green - Filter Blue Filter color.

Octave

The higher the octave the noisier is the texture.

Example

1.73 Radial

RADIAL

This texture varies the color of the object radial around the texture axis.

Parameters:

Start radius
Interploation start radius.

End radius
Interploation end radius.

Color Red - Color Green - Color Blue Color to interpolate to.

Reflect Red - Reflect Green - Reflect Blue Reflect to interpolate to.

Filter Red - Filter Green - Filter Blue Filter to interpolate to.

Example

1.74 Stars

STARS

This texture applies randomly stars to the surface.

Parameters:

Color Red - Color Green - Color Blue Color of the stars.

RayStorm Documentation 49 / 53

Density

Star density. The higher the more stars (0. - 1.).

Example

1.75 Known Bugs

KNOWN BUGS

- Bump doesn't work properly.
- Problems to animate Imagine objects with brushes on them.

1.76 Legal Stuff

1.80 History of Changes

HISTORY

```
version 1.0 (09-July-95)
- first release.
```

version 1.01 (15-August-95)

- added soft shadows
- added random jitter
- added brush repeat and mirror

```
version 1.02 (16-August-95)
- bugfix: altitude mapping -> black object: fixed
- bugfix: loading of TDDD-objects with brushes crashed: fixed
- added backdrop picture
- added BRIGHT-flags for surface
- added fog
- deleted TRANSATTU
version 1.03 (17-August-95)
- bugfix: sphere intersection test: fixed
version 1.04 (21-August-95)
- added global fog
version 1.05 (28-August-95)
- added animation commands
version 1.06 (01-September-95)
- added motion blur
version 1.07 (10-September-95)
- added specular brush mapping
version 1.08 (11-September-95)
- added rendering box
version 1.081 (08-October-95)
- added listview for history
- added global reflection map
- changed error messages
version 1.082 (11-October-95)
- improved memory management for Imagine objects
version 1.083 (12-October-95)
- changed spotlight direction to lookpoint and added actor for lookpoint
- new form for vectors '<x,y,z>'
- new form for colors '[r,g,b]'
version 1.1 (18-October-95)
- next offical release
version 1.11 (19-October-95)
- bugfix: Imagine fog objects are now loaded properly
- added parameter check for field rendering
version 1.12 (21-October-95)
- speedup of motion blur
version 1.13 (01-November-95)
- now more than one path with PATH-commands possible
- bugfix: spotlight look point changed camera view point
- added soft interpolation of colors for brushmapping
- bugfix: objects behind light sources casted shadows
version 1.14 (03-November-95)
```

RayStorm Documentation 52 / 53

- changed default gaussian filter width from 1.8 to 1.3 - bugfix: problem with global fog - plane can now be animated - changed axis position in flat brush mapping - added 'Time spend' and 'Time left' version 1.15 (28-November-95) - added PNG- and ILBM-modules - added radial texture version 1.16 (09-January-96) - bugfix in PNG-module: had problems with palette pictures - bugfix motion blur: had a problem with voxel calculations - bugfix motion blur: had no motion blur in scenes with planes - added TGA-module - added 'SOFTSHADOW' to 'DISTRIB' - optimized octree (up to 10% faster) - added 'FALLOFF' for 'POINTLIGHT' and 'SPOTLIGHT' - bugfix can now load plane

1.81 PC-version

PC-VERSION

The PC version is available on the Internet.

The most import differences between the PC-Version and the Amiga-Version are:

- the Amiga-Version is able to load Imagine texture-files

- bugfix can now load multiple planes or perfect spheres

- the PC-Version uses its own script language, whereas the Amiga-Version uses ARexx

1.82 Homepage

HOMEPAGE

Come and visit our RayStorm-Homepage! There you can always get the latest version of RayStorm and can see some example pictures.

The address:

http://sol.wohnheim.uni-ulm.de/~calvin/raystorm.html

1.83 Future

```
FUTURE ADDITIONS
```

- modeler
- more objects (torus, cylinder, ...)

RayStorm Documentation 53 / 53

- JPEG-saver
- use Imagine staging files
- animation language (ALAN)
- shadow caching
- more textures
- $\operatorname{don'} t$ allocate whole picture buffer at once
- diffuse reflectivity
- diffuse transparency
- better light FX
- log file
- apply post-2D-FX
- spline interpolation
- load Lightwave format
- load 3DS format
- CSG (Constructive Solid Geometry)
