

## Some of the Options available are:

- Number of clock cycles to store for display in the Timing

Diagrams window.

- Printing in color - uses color pictures for the background.

- 

New Wires Remain Selected - will leave the selection

marquee around the last wire 'drawn'.

- CPU Hog - this option is available for when you think more

speed is required. If checked, no time is given to

background processes when a simulation is running. This

is a rather 'unfriendly' practice and should be avoided!

NOTE: CPU Hog can only increase performance when the

clock is in free run mode and the frequency slider is all

the way to the right. (the difference is most noticeable

in black and white.)

- Show Preview when Opening Files - will show a picture of

the chips that are used in the saved file.
