Errata

Requirements

Threshold requires System 7.0 or later.

Threshold has been tested on most current flavors of PowerBooks. It will not work on a Duo.

Threshold was designed as a stand-alone application for two reasons - to minimize the possibility of conflicts with other programs (with CDEV's or INIT's, there's always a risk), and to allow you maximum flexibility with free RAM. If you need more memory, simply quit Threshold (with a CDEV or INIT, you'll have to reboot, wasting time and battery power).

Thanks!

I want to thank some people who've helped make this program possible, in no particular order...

Dave Madole, Joseph Van, Sharyn Evans, Kirke Lawton, Randall Furushima, DMRay, William New, Mike Wingstrom, Steve Christensen, Markus Wallgren, Paul Allen, David Howarth, and Rich Wolfson. Thanks to John Fernandez for his cool folder icons!

References

The information used to write Threshold and this manual has been culled from various sources, including:

Inside Macintosh, Volume VI (Apple, published by Addison Wesley). This volume contains a discussion of the Power Manager software.

Macintosh PowerBook Family Developer Notes (Apple). Discusses technical side of PowerBook hardware and firmware.

The PowerBook Companion (Richard Wolfson, Addison Wesley). A great book with loads of tips for PowerBook users (did you know that when Apple prepares your PowerBook hard drive, megabytes of hard drive space are unused? Buy the book and find out how to get it back!).

Development environment

Threshold has been developed using:

PowerBook 165c 8/80.

Apple's ResEdit, version 2.1.

•

Symantec THINK C 6.0. This is one of the best C development environments I've seen - it only lacks a configuration management system of similar quality.

Symantec THINK C Reference. I use this so much my printed copies of "Inside Macintosh" are getting dusty. A truly useful tool if you're doing any sort of Macintosh programming - the code examples alone are worth the price!

Apple's "Inside Macintosh", volumes I-VI.
