 Size of FLC file:    11,640,970 bytes
       Resolution:    211x211
```

Comments:

This animation is a demonstration of all the Distortion Effects in *PhotoMorph*. A basic checkerboard pattern is used so that each effect is clearly illustrated. The titling of each clip was done using the Frame/Caption utility built into *PhotoMorph*. Every transition effect available in *PhotoMorph* is used to segue between clips. For information about the Distortion Effects, (i.e.: Lens, Ripple, Tear) see the ***Distortion Effects*** section of ***How Pro's Morph***. For information regarding the Transition Effects, (i.e.: Slide Right, Fade to Image) see the ***Transition Effects*** section of ***How Pro's Morph***. It is interesting to note that the .flc file format was chosen for this animation. This was done because of problems with the Indeo 3 and Cinepak compression algorithms specified in the .avi file format. See the ***Advanced Tips & Tricks*** section of ***How Pro's Morph*** for a discussion of these issues.
