IIFTP Client/Server Installation

[Overview](#) [Installation](#) [Registration](#) [Copyright](#) [Bug Reports](#)

To Install IIFTP, Create a directory and call it for example: C:\IIFTP, Place the following files from the distribution diskette or distribution compressed file into that directory:

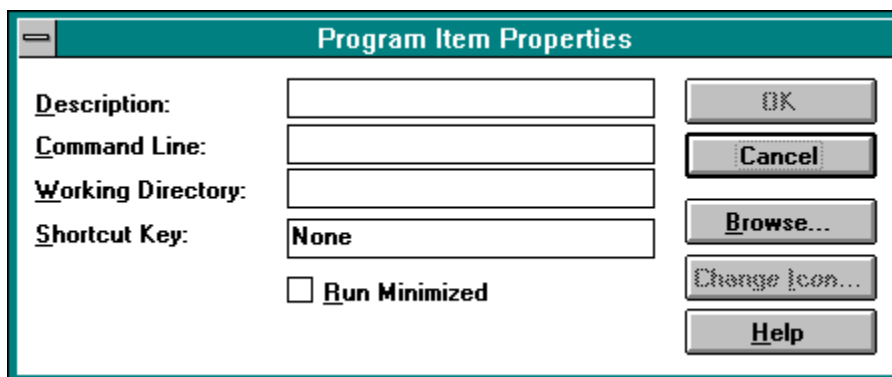

- IIFTP.EXE
- IIFTP.HLP
- IIFTP.INI
- IIFTP.TXT
- IIFTPPS.EXE
- IIFTPPS.INI
- ORDER.FRM

If the following files do not already exist in your \WINDOWS\SYSTEM directory, Please Move them to your \WINDOWS\SYSTEM directory from the distribution diskette:

- WINMSG.VBX
- THREEED.VBX
- CMDIALOG.VBX

At this point IIFTP is ready to be run, However you may also want to create a Program Manager Icon for IIFTP. To create the Icon, follow these steps:

- Select the *Program Group* you would like to create the Icons in
- Select the *File|New|Program Item* from the pull down menu in the Program Manager
- Type "IIFTP Client" in the *Description Field* of the Program Item Properties Dialog Box
- Click on the *Browse* button, change to the path where IIFTP.EXE is located, Select IIFTP.EXE and Click the *OK* button to except the selection
- The *Command Line Field* should now display the Full Path and Filename of IIFTP.EXE
- The *Working Directory*, *Run Minimized* and *Shortcut Key* fields are optional
- Click the *OK* button to except the New Program Item

IIFTP.EXE is the only Icon you will need to make as the Personal Server can be started form the Client. If you would prefer to make the Personal Server Icon then please repeat the above steps replacing IIFTP.EXE with IIFTPPS.EXE and "IIFTP

Client" with "IIFTP Server".

Overview

[Overview](#) **[Installation](#)** **[Registration](#)** **[Copyright](#)** **[Bug Reports](#)**

IIFTP has several options not currently found on other FTP Clients as well as many options currently offered. One of the most unique options to Integrated Internet™ is the FTP "Personal Server". This server will allow connections in either 'anonymous' or 'Username/Password' type logins to your own personal FTP Site. FTP Personal Server has very minimal configuration, you can set anonymous access on or off, specify a default path for anonymous logins and specify a default path for password logins. Anonymous logins have very limited access to your computer while password logins have sufficient control to move, delete, copy or send files and make or remove directories. Due to the fact that this is a personal FTP site, only one login name and password are configurable and the server will only allow one connection at a time to the FTP Site.

Integrated Internet FTP Client Features

[Overview](#) [Installation](#) [Registration](#) [Copyright](#) [Bug Reports](#)

- **Password Encryption**
- **Allows Firewall Access**
- **Allows PASV Transfer Mode**
- **Send Mail Via The INTERNAL SMTP Editor**
- **IP Number Caching for Faster Connections**
- **FULL Session Caching for Faster Access to Frequently Used Sites**
- **Access to Cached Directories from a Pull-Down List While Connected to a Remote Site**
- **Local Logon To The FTP Personal Server Via The FTP Client**
- **Quick Connect Feature for Those One-Time Connects**
- **Allows Loading Alternate INI Files From the Command Line or the Main Screen**
- **Allows Alternate PORT Assignments for Logging Into Sites Located on Ports Other Than the *Standard FTP Service Port* of 21**
- **Allows Data Transfer in ASCII or Binary and is Switchable From the Main Screen**
- **View Files by Date,Size,Name in Either Accending or Decending Order Switchable From the Main Screen**
- **View Directories Sorted or Unsorted Switchable From the Main Screen**
- **View Links as Directories or Files Switchable From the Main Screen**
- **Confirmation on Delete, Replace and Directory Delete Switchable From the Main Screen**

Server Special Considerations

[Overview](#) **[Installation](#)** **[Registration](#)** **[Copyright](#)** **[Bug Reports](#)**

The setup area for "Integrated Internet FTP Personal Server" is located in the FTP Clients Pull Down Menu. Click Personal Server|Server Configuration on the Pull Down Menu to change the default settings in the server. The changes are automatic, the server does not have to be shut-down in order for the changes to take effect. Also the LOG file for the server is removed when the server is shut-down for house-keeping. If you want to save the LOG, make a copy or move it to another location before turning off the server.

If the default login path for anonymous logins is say "c:\pub" then the user can only access directories below "c:\pub" such as "c:\pub\files". The user cannot access "c:\\" or any other directory that does not start with "c:\pub\". The same rule applies for the Password login, however the password login has more rights. The anonymous user can copy files from the access directories, change directories, and in general do anything that would not change anything on your system. The Password user can do virtually anything you can do locally such as Delete, Copy, Rename, Move or Create files and Make or Remove directories. Be very careful to whom you give access to your password account.

Client Special Considerations

[Overview](#) [Installation](#) [Registration](#) [Copyright](#) [Bug Reports](#)

When the FTP Client is first run, it will ask for an E-Mail address and a text viewer to use for viewing both local and remote text files. The most common text viewer for Windows is NOTEPAD.EXE which is included with Windows. This viewer is limited in several ways when dealing with text files from other operating systems such as "UNIX" which makes up about 80-90% of all the FTP Sites. Therefore I have defaulted this to "INTERNAL", the internal text viewer will attempt to automatically detect what type of text file is being viewed and display it properly. The E-Mail address needs to be a fully qualified address (i.e. first.last@service.com). This E-Mail address is used for anonymous logins to FTP Sites.

Also when the FTP Client starts it adds the following lines to your WIN.INI:
[IIFTP]

INILOC=drive:\path to IIFTP.INI file
CACHELOC=drive:\path to CACHE files

If you relocate the program in the future IIFTP will update these settings automatically. If you run a second copy of the program in a different directory, it will use the INI file specified by these settings unless you specify on the command line to use an alternate INI file.

[Client Command Line Options](#)

[Client Special Considerations](#)

This is a visual indication of whether or not further operations should be attempted on the local system.

If the display is green (**WALK**), then the system is ready for more instructions.

If the display is red (**DONT WALK**), then the system is unready for more instructions.

This box displays the PATH of the local directory.

To change the current drive, pull down this selectable box and choose the appropriate drive to change to.

This box displays the list of available local directories. To change to a different directory, double-click the directory name listed in the box.

This box displays the list of files located in the current local directory. To select a file to perform an operation on (i.e. view,move,etc), click on the filename from the list. To select multiple files, hold down the CTRL key and click on the next file you want selected.

Local Directory Command Buttons

- MKDIR (Make Directory) Displays a dialog box inquiring the name for the new directory
- RMDIR (Remove Directory) Removes the currently selected directory from the local system
- CHDIR (Change Directory) Displays a dialog box inquiring the directory path to change to

Local File Command Buttons

- SEND Starts transferring the currently selected file(s) to the remote system
- VIEW Displays the currently selected file in either the INTERNAL Text Viewer or the user-defined text viewer
- MOVE Displays a dialog box inquiring the new local directory for the selected file(s)
- DELETE Deletes the currently selected file(s) from the local system
- RENAME Displays a dialog box inquiring the new name for the selected file
- REFRESH Re-Displays the current directory and file list
- VIEW LOG While online to a remote site, displays the log of operations that have transpired

Note: If multiple files are selected the VIEW and RENAME options become unavailable

Note: While not online to a remote site the SEND option is unavailable

This area is used to display the communications that is taking place with the remote server. This is the same information that is written to the log file for the session

This is a visual indication of whether or not further operations should be attempted on the remote system.

If the display is green (**WALK**), then the system is ready for more instructions.

If the display is red (**DONT WALK**), then the system is unready for more instructions.

This box displays the current remote path. This is also a pull-down list of cached directories. If you select a path from this list, IIFTP attempts to make that path the current path

While connected this button will display "DisConnect"
and when clicked the system will log out of the remote
system

While not connected this button will display "Connect"
and when clicked will display the Connect Dialog Screen

This box displays the list of available remote directories. To change to a different directory, double-click the directory name listed in the box.

Note: The "." and the ".." are built in commands. The "." will move you back to the previous directory and the ".." will move you to the remote system's root or initial directory.

This box displays the list of files located in the current remote directory. To select a file to perform an operation on (i.e. view,move,etc), click on the filename from the list. To select multiple files, hold down the CTRL key and click on the next file you want selected.

Remote Directory Command Buttons

- MKDIR (Make Directory) Displays a dialog box inquiring the name for the new directory
- RMDIR (Remove Directory) Removes the currently selected directory from the remote system
- CHDIR (Change Directory) Displays a dialog box inquiring the directory path to change to

Remote File Command Buttons

- VIEW Displays the currently selected file in either the INTERNAL Text Viewer or the user-defined text viewer
- MOVE Displays a dialog box inquiring the new remote directory for the selected file(s)
- DELETE Deletes the currently selected file(s) from the remote system
- RENAME Displays a dialog box inquiring the new name for the selected file
- RECEIVE Starts transferring the currently selected file(s) to the local system
- REFRESH Re-Displays the current directory and file list and refreshes the cache files
- DIR INFO displays the directory list as returned by the remote system

Note: If multiple files are selected the VIEW and RENAME options become unavailable

Note: While not online to a remote site the SEND option is unavailable

Client Profile Configuration

[Overview](#) [Installation](#) [Registration](#) [Copyright](#) [Bug Reports](#)

Click on an area of the screen that displays a hand as the mouse pointer

The screenshot shows the 'Profile Configuration' dialog box for IFTP. It features a teal title bar and a grey background. The configuration fields are as follows:

Profile Name	Trumpet Winsock DLL	Port	21
Host Name	ftp.trumpet.com.au	<input type="checkbox"/>	Use Firewall Login
User ID	anonymous	<input checked="" type="checkbox"/>	Anonymous Login
Password	kent.behrens@aquila.com	<input type="checkbox"/>	Save Password
Remote Dir	/ftp/pub/winsock	<input type="checkbox"/>	PASV Data Mode
Local PC Dir		<input checked="" type="checkbox"/>	IP SmartCache(tm)
Last Date On		<input checked="" type="checkbox"/>	Session SmartCache(tm)

Below the fields is a list of 'Profile Names' with 'Trumpet Winsock DLL' selected. To the right of the list are buttons for 'New', 'Connect', 'Save', 'Cancel', 'Delete', and 'Help'. The IFTP logo is visible in the bottom left corner.

[Client System Configuration](#)
[Client Firewall Configuration](#)
[Personal Server Configuration](#)

This is the *Profile Name* that's used by IIFTP to retrieve and store saved profile configurations. The profile name must be unique from any other profile name already configured

The *Port* defaults to the *Standard FTP Service Port* of 21. If the FTP Site that you're configuring uses a different port, this field can be changed to the port of the remote FTP Site

This is the *HOST Name* for the FTP Site that you want to configure. This field is required in order for IIFTP to be able to contact the FTP Site. The HOST Name can either be a valid HOST Name like: "ftp.microsoft.com" or a valid IP Address like: "199.23.8.56"

The *USERID* will either be "anonymous" or if you have a secured account on an FTP Site this will be your login ID as assigned by your provider

The *PASSWORD* will either be your E-Mail address or if you have a secured account on an FTP site then this will be the login Password as assigned by your provider

The *Remote Host Dir* is optional. However if used, this field will tell IIFTP to go directly to the specified remote directory when initially logging into the remote site

Like the *Remote Host Dir*, the *Local PC Dir* is optional. However if used, this field will tell IIFTP to go directly to the specified local directory when initially logging into the remote site

The *Last Date On* field is for display and information purposes only. This field cannot be changed from the Profile Configuration Screen. This field is automatically updated every time you successfully login to an FTP Site

This area *Profile Names* is where you select the *Profile* that you would like to connect to. There are several ways to initiate a connection from this area. One way would be to select the Profile by Clicking on the Profile Name, then Click on the Connect button in the lower right side of the screen. Another way would be to Double Click on the Profile Name.

If the *Use Firewall Login* checkbox is checked then IIFTP will attempt to login to your firewall server before attempting to login to the selected FTP site. *NOTE:* you must setup the Client Firewall Configuration before attempting to login with this method

If the *Anonymous Login* checkbox is checked then IIFTP will attempt to login to the selected FTP site using the word "anonymous" as your login User ID and your E-Mail address as your login password. *NOTE:* the E-Mail address IIFTP will use is the address setup in the Client System Configuration

If the *Save Password* checkbox is checked when the *Save Button* is clicked, IIFTP will save the password along with the rest of the configuration. This option is usefull if you have other persons using your copy of IIFTP. When logging into an FTP Site, IIFTP will prompt you for a password to the system if a password is not available for the configuration

The *PASV Data Mode* checkbox informs IIFTP the proper method it should use to transfer files to/from the remote FTP Site. Most Internet Providers do not allow the *PASV Data Mode* due to some security concerns on their part. If this checkbox is checked, IIFTP will attempt to transfer the data in Passive Mode otherwise it will transfer the data in Non-Passive Mode

When checked, the *IP SmartCache™* checkbox informs IIFTP to use the stored IP Number to connect to the selected FTP Site. When unchecked, IIFTP will try and resolve the Host Name from the *Host Name Field*. The Host Name resolving process can occasionally take quite some time. By caching the IP Number, we can speed up the connection process

When checked, the *Session SmartCache™* checkbox informs IIFTP to not delete the cache files from the FTP Site when you dis-connect. This speeds up the process of working with directories on the next connection to that site. Since most systems directories change on a daily basis, the caching automatically refreshes on the following day

Clicking the *New* button will clear all of the above fields and fill them with the default information. Enter the required and optional information into the above fields. Click the *Save* button to save the New profile to disk

After you have entered all of the required and optional information into the above fields, Click the *Save* button to save the *New* or *Updated* profile information to disk

After selecting a profile from the list in the bottom left corner of the screen, Click the *Connect* button to initiate a connection to that site

Clicking the *Delete* button will cause the currently selected profile to be deleted from the profile configuration

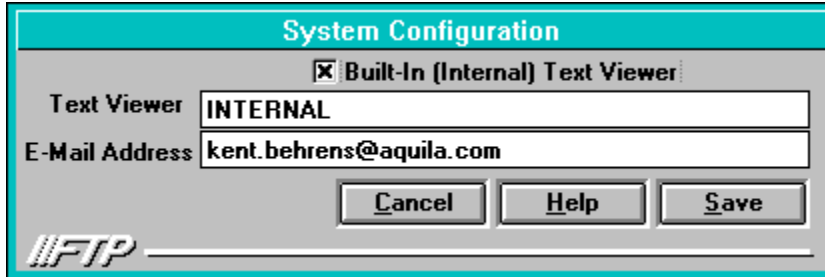

Clicking the *Cancel* button will remove this screen and return you back to the IIFTP Main Screen

Clicking the *Help* button will cause IIFTP to display *Help* on the area that you're currently located in

Client System Configuration

[Overview](#) [Installation](#) [Registration](#) [Copyright](#) [Bug Reports](#)

Click on an area of the screen that displays a hand as the mouse pointer

The screenshot shows a dialog box titled "System Configuration" with a teal header. Inside the dialog, there is a checked checkbox labeled "Built-In (Internal) Text Viewer". Below this, there are two text input fields: "Text Viewer" containing the word "INTERNAL" and "E-Mail Address" containing "kent.behrens@aquila.com". At the bottom right of the dialog are three buttons: "Cancel", "Help", and "Save". In the bottom left corner, there is a logo for "I/FTP" with a horizontal line underneath it.

[Client Firewall Configuration](#)

[Personal Server Configuration](#)

Checking this box informs IIFTP to use the *INTERNAL* text viewer for viewing files on the local and remote machines

The field *Text Viewer* is where you would inform IIFTP what viewer to use for viewing files on the local and remote machines

The field *E-Mail Address* requires a fully qualified E-Mail Address like "iiftp@aquila.com" or "kent.behrens@aquila.com". This address is used for logging into remote sites as "anonymous"

Clicking the *Cancel* button will remove this screen and return you back to the IIFTP Main Screen

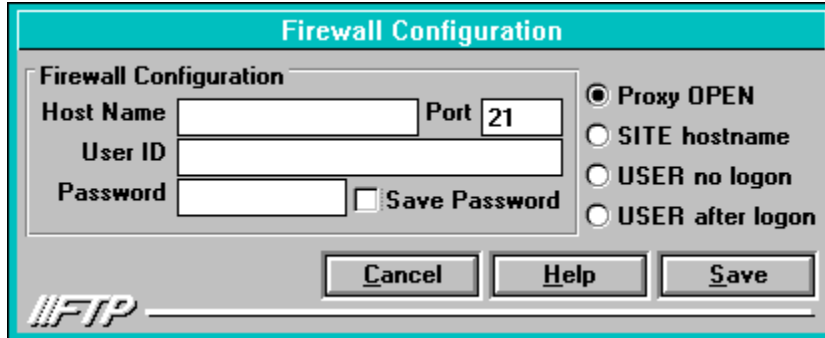

Clicking the *Help* button will cause IIFTP to display *Help* on the area that you're currently located in

After you have entered all of the required information into the above fields, Click the *Save* button to save the *New* or *Updated* system information to disk

Client Firewall Configuration

[Overview](#) [Installation](#) [Registration](#) [Copyright](#) [Bug Reports](#)

Click on an area of the screen that displays a hand as the mouse pointer

The screenshot shows a dialog box titled "Firewall Configuration" with a teal header. Inside, there is a section titled "Firewall Configuration" containing several input fields and radio buttons. The "Host Name" field is empty, and the "Port" field contains the number "21". The "User ID" and "Password" fields are also empty. There is a checkbox labeled "Save Password" which is unchecked. To the right of these fields are three radio buttons: "Proxy OPEN" (which is selected), "SITE hostname", and "USER no logon". Below the radio buttons is another radio button labeled "USER after logon". At the bottom of the dialog box are three buttons: "Cancel", "Help", and "Save". In the bottom left corner, there is a logo that reads "IFTP".

[Client System Configuration](#)

[Client Profile Configuration](#)

[Personal Server Configuration](#)

This is the *HOST Name* for the firewall server. This field is required in order for IIFTP to be able to connect to the firewall server. The HOST Name can either be a valid HOST Name like: "ftp.microsoft.com" or a valid IP Address like: "199.23.5.56"

The *USERID* will be the login ID to the firewall server as assigned by your Network Administrator

The *PASSWORD* will be the login password as assigned by your Network Administrator

The *Port* defaults to the *Standard FTP Service Port* of 21.
If the firewall server is located on a different port, this field
can be changed to the port of the firewall server

If the *Save Password* checkbox is checked when the *Save Button* is clicked, IIFTP will save the password along with the rest of the firewall configuration. This option is usefull if you have other persons using your copy of IIFTP. When logging into the firewall server, IIFTP will prompt you for a password to the system if a password is not available for the configuration

The Firewall Mode of *Proxy OPEN* first connects to the firewall server, sends the OPEN hostname command to the firewall server, then logs into the remote site

The Firewall Mode of *USER no logon* first connects to the firewall server, sends the USER userid@hostname command to the firewall server, then logs into the remote site with the password only

The Firewall Mode of *USER after logon* first connects to the firewall server, logs into the server, sends the USER userid@hostname command to the firewall server, then logs into the remote site with the password only

The Firewall Mode of *SITE hostname* first connects to the firewall server, sends the SITE hostname command to the firewall server, then logs into the remote site

Clicking the *Help* button will cause IIFTP to display *Help* on the area that you're currently located in

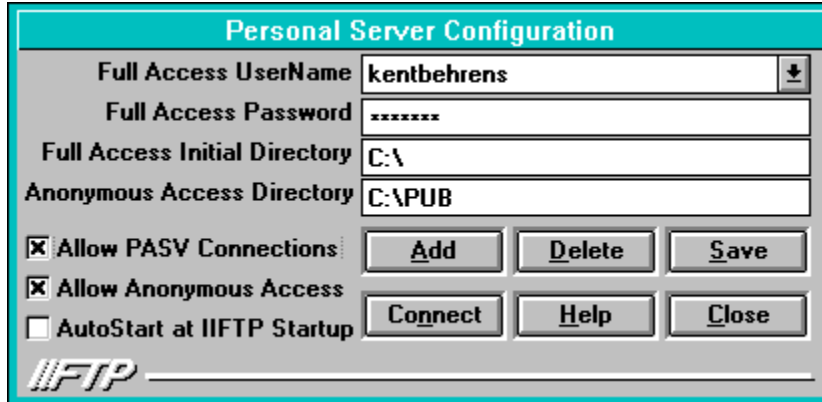

Clicking the *Cancel* button will remove this screen and return you back to the IIFTP Main Screen

After you have entered all of the required and optional information into the fields, Click the *Save* button to save the *New* or *Updated* firewall information to disk

Personal Server Configuration

[Overview](#) [Installation](#) [Registration](#) [Copyright](#) [Bug Reports](#)

Click on an area of the screen that displays a hand as the mouse pointer

The screenshot shows a dialog box titled "Personal Server Configuration" with a teal header. It contains several input fields and checkboxes. The "Full Access UserName" field is filled with "kentbehrens" and has a dropdown arrow. The "Full Access Password" field is filled with "*****". The "Full Access Initial Directory" field is filled with "C:\\". The "Anonymous Access Directory" field is filled with "C:\PUB". There are three checkboxes: "Allow PASV Connections" (checked), "Allow Anonymous Access" (checked), and "AutoStart at IIFTP Startup" (unchecked). To the right of the checkboxes are two rows of buttons: "Add", "Delete", and "Save" in the first row; "Connect", "Help", and "Close" in the second row. At the bottom left, there is a logo for "IIFTP" followed by a horizontal line.

See Also

[Client System Configuration](#)

[Client Profile Configuration](#)

[Client Firewall Configuration](#)

The *Full Access Username* field is required for logging into the Personal Server with full access privileges

The *Full Access Password* field is required for logging into the Personal Server with full access privileges

The *Full Access Initial Directory* field is optional. It is recommended if you want Full Access to your system to set this directory to C:\ or the drive that you want access to. This path is designed to be the TOP accessible path. In other words if the Full Access directory is C:\UPDIR\FTPDIR the user will not be able to access C:\UPDIR. Directories below this path will be fully accessible

The *Anonymous Access Initial Directory* field is optional. It is highly recommended that you set this directory to something like C:\PUB or some other specific directory that you are sure the data is safe to be accessed by anyone that might log into your FTP site

Checking this box will enable *PASV Data Connections* on the server. This simply put means that if requested the server will open the Data Connections rather than the Client.

Checking this box will enable *Anonymous Connections* on the server. Otherwise when a connection is made using anonymous as the User ID the server will simply tell the user that *anonymous access is not accepted at this time*

Checking this box will enable the server to be *Auto Started* when the IIFTP Client loads

Clicking the *Close* button will remove this screen and return you back to the IIFTP Main Screen. Be sure to save any changed information before closing

Clicking the *Help* button will cause IIFTP to display *Help* on the area that you're currently located in

After you have entered the information into the fields, Click the *Save* button to save the *New* or *Updated* server information to disk. The Server does NOT need to be restarted when these fields are changed. The next connection to the server will reflect the *New* information.

Clicking the *Add* button will display a dialog box inquiring the name of the New Username to add to the configuration file

Clicking the *Connect* button will initiate a connection to the Personal Server using the current Username and Password as the login information

Clicking the *Delete* button will remove the current Username, Password and Initial Directory from the configuration file

Passive Mode or PASV Mode simply means that the Server opens the data connection instead of the Client

Non-Pasive Mode simply means that the Client opens the data connection instead of the Server

A DEMO Program designed to be shared by many people
in a limited or revised edition for evaluation and
consideration of purchase.

FTP is an acronym for *File Transfer Protocol*

Anonymous Logins refers to logging into an FTP Site using "anonymous" as a login username and generally your E-Mail Address as a password
