You have successfully installed *Power Tools for Windows* now. Before you start running Power Tools, here is some helpful guidelines which will help you through Power Tools folders.

Once you run Power Tools, it will present you with a main folder of the program catalogs. You can choose any program catalog by clicking the mouse on its icon button or by pressing its associated letter key and then enter key. For example, click on the Fonts button to activate fonts program category.

Again, once you have selected a program group by clicking the mouse on the icon button or pressing its letter key, Power Tools presents you with the list of programs available within that folder.

You can choose a program by clicking the icon button. Power Tools will open a dialog box and show the default drive and directory where the selected program will be copied to.

Power Tools uses the PKUNZIP utility to copy program from CD to default drive and directory, however, if you choose another path, you can overwrite the default path simply by overtyping the default path. Click on the OK button and the program will be copied to the specified directory.

We recommend using mouse instead of keyboard for selecting items in each folder since in some instances using keyboard causes paint problems.
