

## **DOS Shell Launcher**

This is my first Visual Basic project. It was namely created in order to create several DOS shells to jump into if needed. I wanted to save each of my VB projects in its own subdirectory; but the save routines don't seem to have any provisions for creating subdirectories.

What DOS Shell Launcher does is creates one minimized DOS task per press of the "Launch" button. Once you have as many as you desire, Press the "End" button. This Project is simple in the extreme; and I don't reserve any rights to the source.
