

Crystal Reports Technical Document

Subject: Database Engine Already Initialized

Date: November 8, 1993

Versions: VB Applications

Situation:

When calling a report from a Visual Basic application the "Database Engine Already Initialized" error is reported.

Solution:

Manually open and close the Access data-engine with direct calls to the CRPE.DLL.

Place the following in the General Declarations section:

```
Declare Sub PEOpenEngine Lib "CRPE.DLL" ()  
Declare Sub PECloseEngine Lib "CRPE.DLL" ()
```

Then within the code for the application, use the PE calls to get the data-engine into the necessary state. This may require some experimentation.
